JANUARY 1958

BRADFORD WASHBURN EXPLORES MCKINLEY

WITH HIS POLAROID LAND CAMERA

Uttarpara Jaikrishna Public Library
Accn. No. 19917 Date 19.10.

Washburn used a Polaroid Yellow Filter with shutter Ser 1 15 to get this bulliant result from new Type 41 Polaroid black-and-white film. The day was cold and bright—an equivalent back-ground reading of Weston 800-1000.

Bradford Washburn's pictures have made McKinley one of the world's best-photographed mountains. On this year's ascent, he took a Polaroid Camera to record a new route up the 20,270-foot Alaskan peak.

According to Washburn, the Polaroid picture-in-aminute Camera was "indispensable to the success of our high-altitude survey work, enabling the survey party to identify twice as many control points as ever before." And it operated perfectly under tough conditions.

You don't have to be an explorer to share in the exciting adventure of picture-in-a-minute photography. It's so simple to achieve new effects, to get better results, to open a whole new world of picture possibilities, when you can check your work right on the spot! and -- you get the added thrill of seeing your pictures as you take them. Polaroid prints make fine enlargements, too, Extra copies and negatives are easy — and inexpensive.

Whether you're an old hand or a beginner, ask your photo dealer for a demonstration of the Polaroid Land Camera. You'll wonder why you ever waited.

POLAROID ACCESSORIES:

flash gun, battery type #200, \$11.95; filter kit, \$6.84; close-up kit, \$10.29; master compartment case, \$29.75; special G. E. exposure meter, \$15.75.

FOR FREE BOOKLET, "38 Ways to Make the Most of 60-Second Photography," write Polaroid Corporation, Department PS-4, Cambridge 39, Mass.

POLAROID Land CAMERA

The world's most exciting camera

For complete versatility in the darkroom

... a complete line of specialpurpose chemicals from Ansco's famous laboratories. No darkroom is up to date without them!

Whatever the quality of the original exposure, the nature of the subject, or the conditions under which the shot was taken, Ansco chemicals afford maximum scope for your personal artistry as expressed in the finished print.

Here are five different chemical preparations that belong on every darkroom shelf.

Want it COLD and sparkling?

ANSCO VIVIDOL Paper Developer

Use

Get brilliant highlights contrasting with deep, neutral black image tones. (For best results, use Ansco Cykora or Convira papers.)

Want it WARM and rich?

Use **ANSCO** ARDOL

Developer

Particularly desirable for rich. warm toned portrait prints. (Recommended papers: Ansco Indiatone and Cykora.)

Want to. REDUCE density?

Use **ANSCO** Reducer

Either for special, "trick" effects, or to reduce excessive density of negatives that have been overexposed or overdeveloped, or both.

Want to INCREASE density?

Use **ANSCO** Mercury Intensifier

It helps you get the best possible prints from weak, underdeveloped negatives. Ansco also supplies a packaged Copper Intensifier.

Want to VARY density?

Use **ANSCO** New Coccine

Heighten the density of local areas in the negative, leaving the rest as is, or after over-all treatment with Ansco Reducer.

Get these chemical preparations from your Ansco dealer. He will also furnish you with information about the many other Ansco products available to help you make better pictures.

THE PRESIDENT REPORTS .

The highest compliments and commendation to the officers and members of COLOR DIVISION for a most praiseworthy accomplishment!

Two or three years ago, they saw the possibilities in stereo photography as a potent area of photographic interest. With finest forethought, they went to work at a time when few others had any great faith in the rebirth of this old kind of camera work. They laid out a program for both immediate activity and long-range value, and they implemented that program efficiently and well.

Today the infant they found on the doorstep and took in as a beloved foundling has reached the point where it can stand alone. Its training, its health, and its basic and vital strength are firm: thanks to CD it can now begin to make its own way in a world that seems to demand a good start for its new citizens.

Accordingly, the Board of Directors have voted to establish a new Stereo Division. We all extend an enthusiastic welcome to SD! And PSA extends an equally warm welcome to all photographers who are interested in this most realistic of all kinds of photography!

A new Division requires much from many—something from all of us. Every PSA member who would like to have a part in making the new SD important to American photography is most cordially invited to "get into the act" by writing Dr. Frank E. Rice, 307 North Michigan Avenuc, Chicago 1, Ill., the SD Chairman. I hear he is establishing a "Founders' Group" which will be limited to the first 100 or so who join SD. I—most selfishly—took advantage of the advance information and sent in my dollar for SD membership.

Spee Wright, Chairman of the Membership Committee, is working with Dr. Rice on his end of SD, and so are many of the members of CD who will remain as fosterparents of the new child they have so proudly raised. When you join SD or suggest to a stereo worker that he should join PSA and SD, keep in mind both the great potentialities of stereo and all that every PSA member owes to COLOR for what

they have done for Photography and PSA in giving our youngest Division its grand start.

If you'd like an active part in SD, drop a line to Frank Rice and ask for a job. There is plenty to do.

A Convention Echo

After the Detroit Convention, I wrote the Honorable G. Mennen Williams, Governor of the State of Michigan, thanking him for honoring us with his presence at the Honors Dinner and apologizing for the intrusion of politics in the dinner speeches.

His answer, forgiving us completely for everything, is a masterpiece. I only regret that it cannot be reproduced for all of us to read and enjoy.

Why Not?

How much do you get out of PSA or your membership in a club or a business association—or your camera, for that matter?

None of them does you much good unless you make use of it. You can—maybe—enjoy owning a nice camera sitting up there on the shelf; you can attend meetings and listen to speakers; you can read PSA JOURNAL and the Division publications; but you won't ever get what you want until you make use of what any one of these grand things offers.

You won't really enjoy and benefit from your PSA membership until you are really a part of the organization—until it becomes your own association, because you are having a share in carrying on its work and helping to build its future.

Make use of the services offered by your Division or the Society—certainly for all of them are valuable and helpful—but then increase what PSA can do for you by doing as much as you can for and in PSA. Your fun begins when you start working with your fellow-members on one or more committees.

Why not pick your spot and volunteer now?

Norris Harkness

take it easy-with stereo-Realist

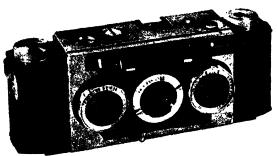

TAKE WHAT YOU SEE...THEN SEE **EXACTLY** WHAT YOU TAKE

THERE are many reasons why it's easy to take beautiful, full-color pictures in thrilling third dimension with the REALIST—the biggest thing in present-day photography. If a scene is pleasing to your eyes, snap it. When you see the stereo slide in your REALIST Viewer, the picture will be equally pleasing because REALIST pictures are exact duplicates of the original scene... with true-to-life depth and in natural color.

It's as simple as that. No fussing about perspective or composition . . . no juggling of equipment. Just take what you see . . . then see exactly what you take!

Complete novices can take good pictures with the REALIST from the very first roll of film. Experts find it a new thrill. For in third dimension people are so lifelike you almost expect them to speak... scenic views indescribable in their fragrance... scenic views indescribable in their grandeur. If you haven't seen REALIST pictures, ask your dealer to show you some. Prove to yourself that you, too, can "take it easy" with the REALIST. For the name of your nearest dealer and descriptive catalog write: DAVID WHITE COMPANY, 387 W. Court St., Milwaukee 12, Wis.

NEW AIDS FOR BETTER PICTURE-MAKING

JACOB DESCHIN, APSA

Every once in a while somebody starts counting camera heads around the country and the result is a new figure on the extent to which photography has gripped the citizenry of these United States. The latest comes from a new survey, this time by Frank W. Mansfield, sales research director for Sylvania Electric Products, Inc., the results of which were released at a cozy breakfast meeting in New York recently. Basing his findings on an intensive house-to-house canvas and casual questioning in the streets of towns and cities across the country, Mr. Mansfield and his assistants found that seventy percent of all American households today have a

To point up his findings and to see how they stack up with other things American folks believe to be worth while, he compared the figure with those for other conveniences. He found that the figure was about the same for owners of automobiles. Seventy-five percent of the households have a bathtub, it was learned; sixty-three percent a telephone, and eighty percent a mechanical refrigerator. The 32,000,000 of the 43,500,000 total households in the

United States that owned or used a camera during 1950, when the survey was made, had at their disposal almost 52,000,000 cameras, Mr. Mansfield said.

Reporting specifically on the use of flash by amateurs, the researcher said he learned that eighty per cent of those questioned said they had been using flash less than four years, indicating that most of the progress in this direction has been made in this short period. In the two-year period in question—1948-1950—the total number of flash pictures taken jumped from 117,800,000 in 1948 to 230,000,000 in 1950. At this rate, Mr. Mansfield made bold to predict, the annual consumption of flash lamps will rise to somewhere between 490,000,000 and 730,000,000 by 1955.

Three factors appear to be mainly responsible for this phenomenal growth: the introduction of inexpensive flash-synchronized cameras, which now total about 8,000,000 costing under \$20; the fact that eighty per cent of all cameras in use today are equipped with flash guns; and the growing use of flash cameras in the home by women.

It will be "some months", the man says,

before you'll see it, but that 3,000 ASA film you've been hearing about is really a fact. I refer, of course, to Dr. Edwin H. Land's announcement at the American Institute of Physics convention in Chicago a few months ago. On that occasion, he disclosed that the Polaroid picture-in-a-minute film can be made considerably faster by employing a new speed-up effect. But the secret is in the process, rather than in the film. To prove his point, he showed his audience a snapshot of a group listening to an address in the Chicago Civic Opera House. It was demonstrated again, though without fanfare, by Polaroid's Richard T. Kriebel at the U.S. Camera Achievement Awards dinner in Rochester recently. An exposure of f/5.6 at 1/25th by the ordinary lighting at the festivities produced a picture, after the usual minute, that was actually overexposed! The job could have been achieved at f/8 and maybe a little smaller stop. Sample, Dick? Sorry, bub, not yet. It's all for the Army for a while.

Got a product idea you think would bowl them over if you could only get someone to back it? Well, here's your chance, but it's gotta be good. Brownforman Distillers Corporation recently formed Brown-Forman Industries, a division initially started to encourage the company's employees to develop new products but now ready to welcome ideas to individuals outside the company as well.

The first products to be sponsored by the division in the photographic field have just been announced. They are a print flattening solution, BFI No. 20 and a hypo neutralizer, BFI No. 30. The first is said by the manufacturer to be an excellent reconditioner for old, damaged or brittle prints, and to provide an excellent base for retouching and tinting. Other advantages claimed for the new flattener are: retention and maintenance of moisture inherent in the print; penetration of the paper support of the print and lubrication of fibres; prevents whites from yellowing and blacks from becoming brown; imparts a high gloss to glossy papers, and facilitates drying. The hypo neutralizer will, according to the makers: neutralize the silver thiosulfate; has stability and long life in an open tray; requires no after-treatment to correct the degradation of the print's tones, and will not cause sticking to drum driers.

The Imp, a five-ounce 35mm camera with a "built-in" mailing service, was recently placed on the market by Beaurline Industries, St. Paul, Minn. The plastic camera, which costs \$1.79, comes already loaded to take twelve pictures. When all the exposures have been made, the cartoncovered camera is addressed to the manufacturer and a six-cent stamp attached. The maker develops the film and returns twelve enlargements 31/4x31/4 inches. The camera has a fixed-fous lens, one shutter speed, is simple to use and is said to give sharp pictures from four feet to infinity. To take more pictures, one simply buys another Imp camera and repeats the procedure.

A camera that comes in a choice of colors has been imported from Italy by G. A. Buttafarri, 207 Fourth Avenue, New York. The camera is the Rondine, which costs

Where Publishers, Projessionals, Schools and Teachers may present their name, address and one line of advertising message. Rates on application to Editor, PSA JOURNAL, Kutstown, Pa.

COUNTRY SCHOOL OF PHOTOGRAPHY SO. WOODSTOCK, VT.

Tutorial instruction by John W. Doscher in salon photography, pictorial control, color, and special processes.

\$17.50 with carrying case, and the maker is the Ferrania Company, of Italy. It is available with colored leather covering of the following colors: brown, green, blue and red, as well as black. The leather carrying case and carrying strap are in shades matching the color of the camera. Without case, the camera is \$14.50.

The Rectaflex Junior, younger version of the 35mm miniature Italian-made Rectaflex, has been introduced by the importer, Director Products, Inc., 570 Fifth Avenue, New York. The Junior has eye-level, ground-glass focusing; shutter speeds from 1 second to 1/500th; is synchronized at all speeds for flash and speedlight; features helical focusing and is available with a variety of lenses. You can buy the Rectaflex Junior with either a Beta f/3.5, an Angenieux f/2.9 or a Schneider Xenon f/2 coated lens, at \$189.50 to \$219.50, depending on the lens. A complete line of accessory items are also available.

Ansco has announced a new surface, Brilliant, for its line of Indiatone projection papers. The new surface is a double-weight paper combining the oki "crystal" surface with the finely grained surface of such a paper as Kashmir, producing a high surface lustre with a pattern fine enough for making prints as small as 4x5 inches without appreciable loss of detail.

A handy and handsome little wallet, the "Personal Photo Album", a pocket picture wallet covered with simulated alligator and designed to accommodate twelve $2\frac{1}{2}x3\frac{7}{2}$ -inch prints and an identification card, has been placed on the market at 59 cents by Lion Specialties Co., 7518 Thirteenth Ave., Brooklyn 28, N. Y. Looks like a good buy for the money.

Enteco Industries, Inc., 610 Kosciusko Street, Brooklyn 21, N. Y., have added to their fast growing line of camera attachments, a matched set of "close-up" lenses for the Stereo-Realist camera. Each set of two lenses is mounted in duraluminum mounts and are packaged in suede type wallets. Instructions for the \$5.50 set include data charts of subject distances and focusing scales. A set of two lens hoods for the Stereo-Realist that fit over the closeup lenses is also available, at \$3.20.

The same company now has lens attachments for two new lenses of the new model VX Kine-Exakta 35mm single-lens reflex camera. For the camera with the Biotar f/2 in preset diaphragm, Enteco has a combination lens hood and filter holder that screws into the lens mount. The price is \$8. For the new Tessar f/2.8 in preset

diaphragm Enteco has an adapter ring of the screw-in type that sells for \$2.40. The lens hood is \$2.

Heitz and Lightburn, 150 West Fiftyfourth Street, New York 19, importers of the Alpa Reflex 35mm cameras, announce new, lower prices, as follows: Alpa Reflex with Alfinon 5cm f/2.8 lens, \$259; Alpa Reflex, with Alitar 5cm f/1.8 lens, \$357; Alpa Prisma Reflex, with Alfinon, \$329; Alpa Prisma Reflex, with the Alitar, \$427. Most Alpa lenses, from 3.5cm to 200cm, are also 5 to 10 per cent cheaper now. The company has a new adapter ring, \$3.15, for cycglass-wearing photographers to permit The ring, the Montur, easier focusing. allows one to attach a corrected lens to the built-in Kern prism of the Alpa Prisma Reflex.

Sojourning in Detroit for the 1951 PSA Convention, your columnist ran into Ed Farber, of Strobo Research, Milwaukee, Wisc., who described a new Strobo Research Monostrob, the price of which was not then known. The new product is called a three-in-one flash unit: basically it is a six-inch-deep by seven-inch-diameter self-contained unit for general work. In addition, it has a small accessory Shorty Snoot that provides a modeling light and soft light source, and permits the use of a 16-inch reflector for studio work. This reflector is equipped with a Holophane

Our Cover

Our cover this month was selected from the Pictorial Section of the 1951 PSA Exhibition which hung in the Detroit Institute of Arts from October 9 through November 4.

Mr. Challiss Gore, of Orinda, California is a member of the Berkeley Camera Club. He has recently joined the Berkeley Portfolian Club of which Boris Dobro is the sponsor.

"Neighbor" was the print of the year in the Berkeley Camera Club Annual competition judged by K. V. Arntzen, APSA, FRPS, a member of the PSA Board of Directors. It won a second prize in *The Camera* magazine's print of the year contest. It also received honorable mention in the 1951 exhibit of the Northern California Council of Camera Clubs and was hung in the Pittsburgh and Detroit salons.

As to the story behind the picture, Mr. Gore has this to say:

"I found Ed Green, the model, at a very picturesque 100-year old place called Old Mountain Ranch in California's Mother Lode country, on a field trip two or three years ago. As usual, upon getting back to my darkroom and viewing the results, I laid plans for a return trip, feeling that I could do better with the material than I had done. Last year I made the return trip, and was greeted by Ed at the gate. His natural pose is the one you see in the picture. I shot a lot of other negatives, but none measured up to the first one. Ed is an old buckaroo who used to work for Miller & Lux, fabled cattle kings of California in days gone by."

PSA TRADING POST

Open to individual members, free of charge. Limit 25 words each. Copy closes the tenth of the second preceding month before publication.

For Sale—Super Ikonta B, Tessar f/2.8 built-in range finder, case, \$165. Contessa 35, Tessar f/2.8, built-in light meter and range finder, case, accessories \$155. Tsuen Chang, 1325 R, Lincoln, Nebr.

Trade -Speed Graphic 4x5, like new, f/4.7 Ektar, 11 film holders, f.p. adapter, 7 filters, sunshade, flashgun, for Contax and equipment. Ben B. Hains, 2643 Brinker Avc., Ogden, Utah.

Diffuser-Refractor and Modeling Light, and light control lunes permit even more control. The new Monostrob weighs five pounds and "packs a 110-watt-second punch."

Back in New York City, we found that a mound of miscellaneous news had piled up, to wit:

Bell & Howell announced its new Model 200 (single lens) and 200-T (two-lens turret) 16mm magazine load motion picture cameras, adding that the cameras because of their beautiful design had won the Society of Motion Picture Art Directors' Award for 1952. Both cameras have positive viewfinders; a film plane mark engraved on the side of the camera housing for accurate closeups; film winding like a watch; 121/2-foot film run; ASA built-in exposure guide; three-position starting button, for normal operation, continuous running, and single-frame exposures; five operating speeds, 16, 24, 32, 48 and 64 frames per second; easy conversion from single-lens to turret model. With a 1-inch f/2.5 coated lens the Model 200 is \$189.95; with the same lens, the turret model is \$234.95. The new cameras have a dove grey finish and chrome trim.

At the same time, the company announced a new 134W 8mm motion picture camera at \$79.95 (film-spool type, drop-in loading) equipped with a ½-inch f/2.5 Comat lens. It also called attention to cuts in the prices of the 134TA (tri-lens 8mm) to \$129.95, and the 134V single-lens 8mm to \$89.95, both equipped with a ½-inch f/2.5 lens.

Bausch & Lomb, Rochester, N. Y., has a new compact, lightweight 60mm telescope that, the company states, "provides a clearer, more brilliant image than previous models." Only 161/2 inches long, less than half that of former three and fourfoot models, the multi-purpose telescope may be used for amateur astronomy, bird watching, sports events, as a spotting scope on the rifle range, or for general observation. The price is \$95 compared to over \$200 for the old-style 60mm model. Four eyepieces of varying power, 15, 20, 30 and 60, are available. The unit weighs 48 ounces. With an adapter, the scope can be mounted on any camera tripod.

Ansco has opened a new processing laboratory at Union, N. J., for processing

The Popular CIRO Camera Now An Exclusive GRAFLEX Product!

A Great Name Joins GRAFLEX!

CIRO 35

... best buy for low-cost color!

An all-American favorite in the popular-priced field, all-metal Ciro 35, is the only range-finder 35 under \$50. Its features include Wollensak lenses; built-in flash synchronization; coupled rangefinder; film counter. It's a great buy . . . and it's guaranteed by Graflex!

CIRO-FLEX . . . America's Best Selling Twin-lens Reflex!

In a class by itself for ease of operation. One twist of a knob and your focus is razor-sharp on the ground glass! Five models provide a broad price range ... each has field lens for brighter viewing, easier composition; compact steel-welded construction and famous Wollensak lens. Three models have built-in flash synchronization! A prize-winner outdoors, indoors ... for action shots or photo-studies. Another "great" for Graflex!

PACEMAKER GRAPHICS

The famous Speed Graphic has focal plane shutter with governed speeds to 1/1000th.: built-in

flash sync.; the Graflok Back (with Ektalite Field Lens). Crown Graphic is identical, except for focal plane shutter... and costs less!

CENTURY GRAPHIC

Lowest - priced, yet packed with famous Graphic features. Ground glass focus,

Graflok Back, Ektalite Field Lens, built-in flash sync., coated color-corrected F/4.5 lens and fast shutter. It's Graphic quality at a truly budget price!

SUPER D GRAFLEX

Brilliant full-sized image (right side up) makes it certain that what you see, you get! Features the Automatic Diaphragm

for full-aperture focus, focal plane shutter and many other features, including built-in flash synchronization! Ideal for portraits.

WELCOME GIFTS... Graflex and Ciro Accessories.

Your Graflex dealer has everything from lenses to carrying cases. Don't miss the new Graflex Polaroid Land Back (finished prints in a minute!) . . . and the all-metal Graflex Tripod with adjustable center post (packs in a suitcase!)

Ansco Color 8mm and 16mm motion picture film. The new station is geared to process these films within 24 to 48 hours of their arrival. Sheet, foll and 35mm magazine color film will continue to be processed in Binghamton.

A new model of the automatic Sixtomat photoelectric exposure meter, the Sixtomat-I, has been imported by the Mitropa Corp., 50 Broadway, New York. It reads incident and reflected light, has a body of white plastic with chrome trim and is calibrated in ASA exposure indexes. The price is \$32.50.

A Model No. 250 Twin-Surface Print Dryer at \$17.95 has been placed on the market by Fedco Products, Inc., 37 Murray Street, New York. The dryer takes four 8 x 10 prints. The twin surfaces measure 11½ x 17½ inches, each consuming 125 watts. For AC or DC.

A new Syncro-Mite Reflex Flash Unit at \$13.75 is announced by Heiland Research Corp., of Denver, Colo. The unit is designed for use with midget flash lamps on Rolleiflex, Rolleicord, Ciroflex, Kodak Reflex and most other reflex cameras having built-in flash contacts.

New literature:

A revised fifth edition of the Data Book "Kodak Films" (35 cents) has been published by Eastman Kodak.

Five new booklets have just been published by Eastman Kodak Company. "Photographic Greeting Cards" (25 cents), a 24-page booklet on the subject for amateurs who want to make their own, describes and illustrates the techniques involved. "Darkroom Construction for Professional, Photomechanical and Industrial Use" (35 cents) contains 33 pages, illustrated with photographs, charts and drawings, on general principles and detailed plans. "Professional Printing with Kodak Photographic Papers" (50 cents) is a revised edition which in addition to describing the special characteristics of Kodak papers provides a compact manual on printing for advanced workers. Two other new editions recently published are for the Kodak Color Data Book series, "Color Separation and Masking" and "Kodak Dye Transfer Process", each 56 pages long and each costing 50 cents. The first, illustrated with black-and-white and color photographs, diagrams and charts, describes the procedures of making masks and balanced color-separation negatives from positive color transparencies or directly from the subject. The second is believed to be the first really complete coverage of print making by this process.

"Building A Cold Light Enlarger," reprint of a Popular Science article, giving complete instructions for making a homemade enlarger using a camera and an Aristo Cold Light unit, may be obtained free by writing Aristo Cold Grid Lamp Lampany, 106-23 Metropolitan Avenue, Forest Hills, N. Y.

Heiland Research Corp., Denver, Colo. offers free a 20-page, two-color catalogue showing the complete line of Heiland Flash Syncronizers and accessories.

Bell & Howell announces a new how-to-do-it. booklet, "Tips On Making Your Footbell Movie." Your dealer has it.

STEREO

DON BENNETT

We had a pleasant surprise when we opened the November PSA JOURNAL and saw the name of Jack Norling at the head of a very interesting article on stereo. Odd that we should have mentioned his name in the December column, written before receipt of the November issue. Jack Norling has been a motion picture producer for years. Being a gadgeteer at heart, he has always tended towards the types of movie work that require more than the ordinary amount of brain power. delved into animation, optical printing and stereo. He built one of the first autofocus animation cameras that worked. A quiet sort of guy who doesn't talk much, but says plenty when he does open up, Jack has a good engineering background that makes him go into a subject thoroughly. His humor is quiet, too. We remember when he was describing his autofocus camera before the Society of Motion Picture Engineers years ago. After going into all the irtricacies of design, how the cam changed the focal distance as the camera was moved up and down on its track, he told how the shape of the cam was computed by using familiar formulas. Then he quietly capped it by saying something like: "Of course, the lens didn't fit our computations so we tested and filed until the image was sharp throughout the travel.'

His humor showed up too, in the Plymouth film we mentioned last month, the one shown at the New York World's Fair. Most of the audience ducked when a fender got out of control and came right off the screen headed for the looker! It was just Jack playing with the lenses to get the object to appear in front of the stereo window.

That film was quite a job to make. In addition to being in stereo, every frame was photographed individually! The whole film was "stop motion". After each frame was exposed one part or a hundred were moved a fraction of an inch and the next frame was exposed. In some of the more difficult levitation sequences, where parts moved through the air, the making of one second's time on the screen could take an hour or more. Surely a job calling for a great deal of patience.

If you are reading Jack's article, you can see that he is the thorough type of individual who can tackle such a job and carry it through to a successful conclusion. The long lines who waited to see his film in 1939 and 1940 attest its success.

We mentioned the depolarizing effects of thin plastic sections last month. Forgot to include that not all thin plastic sections depolarize. It depends on the type of material. Cellophane is a bad offender but some of the acetates have no effect. In some cases it is necessary to cut on a bias grain so that when the sheet is folded, V-fashion, the effect is canceled, just as crossed polaroids cancel light.

However, we can't get too excited right now about stereo projection. We believe

it will come, but until stereo projectors can be built for the mass market, we aren't excited about paving the way.

Clubs and wealthy addicts can afford stereo projection today, but for the other 99%, let's wait and see. In the meantime don't worry too much about the effects of mounting unless you belong to a club with a projector, or have a bank account that can afford one.

Much more important, to our way of thinking, is the matter of correct mounting. Almost any type of stereo mounting is good enough for viewing. Only ordinary care is needed. If you have little chance of projecting your stereos, just do the best job you can.

If you are able to use a projector, then you must drill yourself to do a superior mounting job. Most important factors are correct spacing and perfect alignment on the baseline . . . no tilts. You can prove this even with a viewer! Slip a slide into your viewer and tilt it even one-sixteenth of an inch. Zowie! No stereo. Consider what happens when that is projected onto a 50-inch screen. Fifty diameters magnification. That sixteenth becomes three inches. Now go the other way . . . a sixteenth of an inch is 62 one-thousandths ... and 62 divided by 50 is 1.1 thousandths, roughly. It is easy to see why your slides must be aligned to the thousandth for projection. Most projectors, of course, have a tilting adjustment to take care of misalignments, but it is possible to mount so accurately that the adjustments need not be touched at all during a projection session.

Julius Kaiser had a good article on level cameras in a recent issue of *Modern Photography*. He proves his point quite well and his suggestion about fastening a level to your camera should not be taken too lightly. You can get away with it for hand viewing, but projection will emphasize your faults.

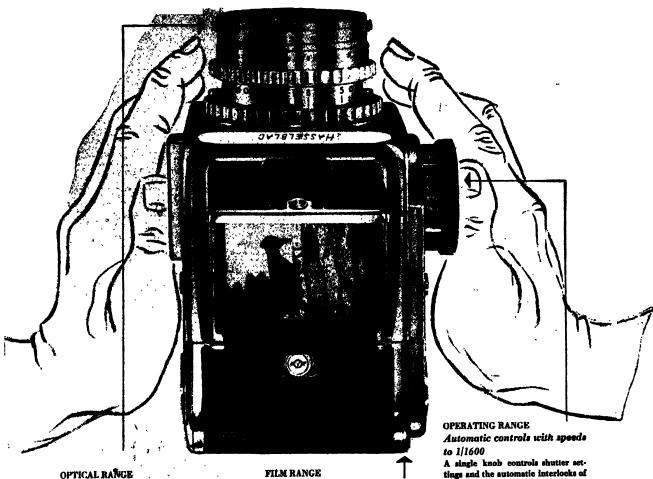

Lots of club activity in stereo. Are we wrong in saying that the New York Stereo Society is the oldest? It was chartered in 1946. Interests are not limited to 35mm stereo and it includes many addicts among its members, men who have been around stereo for a good many years. Information from Owen K. Taylor, 40 Monroe St., New York 2, N. Y. Dues are \$3. Meetings last Friday of each month.

Dayton, Ohio, has a club. Membership about 40, dues \$5. Many of the members are attached to Wright Field. Salem Camera Shop can give you information about this club.

Milwaukee club meets first Wednesday each month. Dues are \$3 and you get information from Mrs. Harold F. Icke, 2833-A N. 9th St., phone LOcust 2-7817.

Hollywood club is quite active, holding frequent contests. Harold Lloyd is active head of the group. Many of the members are familiar to movie-goers.

To get listed here, just let us know the pertinent facts about your stereo club or stereo section. Report on your news and future plans, but see our December column for dates. We must know about it long before it happens, two months before. Address me at 28 Leonard St., Stamford, Conn.

Interchangeable lenses

Your HASSELBLAD comes equipped with the metchless Kodek Ekter Lamenized f 2.8 Lens, focial length -80 mm. Accountry long-focus lenses 135 mm Kodak Ektar and 250 mm (10 in.) Zeiss Opton Sonner. All leuses are quickly interchangeable.

FILM RANGE

Interchangeable magazines You load roll-film in interchangeable magazines, each with an exposure counter. Switch films as you wish. You can use different film emulsions, color or black-and-white, in one camera.

tings and the automatic interlocks of the film advance. Built-in safeguards and indicators reduce possibility of error to the vanishing point. The focal-plane shutter has eleven speeds from 1 to 1/1600 second, and built-in finsh. In the HASSELBLAD - as in no other "reflex" - maximum ease is combined with maximum operating

Never before-such range in a "reflex"

Every few years a new camera really makes history. Such a camera is the HASSELBLAD - the new Swedish "reflex". A few of its features are briefly noted here. Full appreciation of the refinements of design that give this camera unprecedented built-in range must, of course, await your personal inspection. PRICES - The camera, with 80mm Kodak Ektar f/2.8 Lens and 2!4 x 2!4 roll-film magazine, \$535, including Federal Tax. Accessory 135mm Kotlak Ektar f/3.5 Lens, \$250, and 250mm (10 in.) Zeiss Opton Sonnar Lens f/4, \$421.

Calling Oil Colorists

JAMES H. ARCHIBALD

THE COLORING of photographic prints with photo oil colors is a fascinating and profitable hobby. To take a black and white print, and endow it with the glowing beauty of harmonious color is not difficult. Excellent work has been done by students whose only equipment was a sincere desire to produce something that expressed their unrealized talents in a material way. Artistic ability is less useful than a serious determination to master the rules of color harmony.

How, then, can the embryonic colorist develop his—or her—ability to produce pleasing and acceptable hand colored prints? Is it a matter of color knowledge, better tools, a certain type of print paper, or a keener craftsmanship? Frankly, all these are important, but an understanding of color harmony is by far the most helpful. You may have excellent technique, the right paper, good tools, etc., but if your colors are out of tune, then all else is nullified.

Suppose, then, that we enumerate what might be called "The Significant Seven" points in the order of their importance, and elaborate upon them. Here they are:

Understanding of color harmony
The right paper
Print quality *
Tools and touch
Print tone
Paints
Models

Color Harmony

When this is attained through mastery of the simple fundamentals of color, it is more productive of good results than intuition. 'The former says, "I know," and the latter, "I think."

The aspiring photo colorist should make a hue circle similar to Fig. 1. This should be drawn on a white matte photographic paper with India ink, and the ten segments filled in with those photo oil colors best calculated to produce a smoothly balanced hue circle. The initials used in the drawing are self-explanatory. R denotes red; YR yellow red; Y yellow; GY green yellow; G green; BG blue green; B blue; PB purple blue; P purple, and RP red purple. Most photo color manufacturers market kits containing hues similar to those noted above. Before filling in the color segments, arrange your ten colors in sequence on a strip of white matte print paper so you can properly evaluate them for Hue, Value, and Chroma. In color parlance, these are the three dimensions of Color. Hue denotes the color family; Value the depth or lightness, and Chroma the degree of purity or greyness.

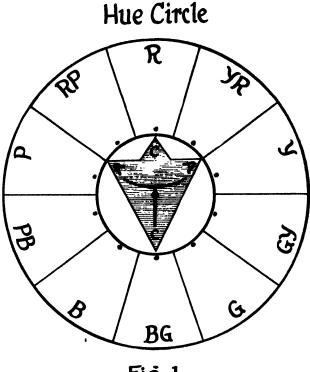

Fig. 1.

In making the hue circle, note the shaded center part. This should be marked off on stiff grey cardboard and attached to the circle so it can rotate, thereby providing the tyro with an automatic device that instantly arranges analogous and complementary harmonies, combined or separate. Set C to any dot and the hues included from A to A give analogous harmony, while those hues opposite C show complementary harmony. A combination of both is the most pleasing, and Fig. 1 shows RP, R, and YR, complemented by BG, a grouping of hues that is perfectly harmonious—and scientifically correct.

In the coloring of scenes from Nature it is well to remember that she is the superlative colorist upon whose palette is never found a discordant color nuance. Anyone who has shot color extensively and viewed it on the beaded screen must admit this as they evaluate the perfect harmonies in all their glory.

Most beginners in scenic colorings commit errors that are based upon their inherited misconceptions of color. Grass is green, so they reach for a tube of color marked green, but what a green! The sky is blue, so in goes a glaring purple blue, and when a brick-red farm house shows up, it has been colored with vermillion or scarlet. So it would be useless to suggest how to match grass, sky,

and bricks, but here is a better idea, which if followed, will help to simplify and beautify scenic color work: Keep your skies a soft violet blue; the grass and foliage a yellowish green; all red objects an orange red, and use raw sienna instead of yellow for the tans and golds.

However, it is in the realm of portraiture that the automatic hue circle will prove its worth, for here we have complete control over the color harmony which best suits the colorist. Average flesh tone is of the orange-red family, and its complement, blue-green or even olive-green, is perfect for a background to enhance the human complexion. However, like all backgrounds, it must be kept soft and neutral in chroma. This arrangement takes care of complementary harmony, and according to the hue circle, we still have available tones of red, orange, and yellow, which could be used in the subject's clothing.

Naturally, when discussing color harmony, it is necessary to use a common nomenclature and limit color names to those mentioned in the hue circle. To those well versed in color, the primary, or fundamental, hues are looked upon as the Adam and Eve of Colordom, from whence millions of related hues, values, and chromas emanate. For this reason the beginner in color must develop an ability to 'see' color everywhere and be increasingly able to classify the related hues that surround him in daily life.

To illustrate this more clearly, suppose we give a few examples. Rose, ruby, maroon, and pink are in the red family; baby blue, Chinese blue, sky blue and navy are in the blue family; peach, ivory, ecru, brown, buff, are closely related to the orange family.

Returning to the use of the automatic hue circle in portraiture or still life studies, it should be pointed out that a slavish adherence to its principles is not recommended. Instead, we shall offer a formula: The largest areas of color should be in related hues embraced from A to A, and enhanced by their complementary at C.

Of course, it is necessary to point out that the colors in the tubes undergo quite a change once they are worked into the print and smoothed off. When applied to a grey print, the cool colors such as violet, blue, and green are less affected than the warmer hues, and when the print is sepia toned the reverse is true. Always remember that your final color tone is a combination of the print tone and the hue worked over it, and be specially careful to preserve the modeling in the print as too much heavy color will obscure the nice play of light and shade.

The Right Paper

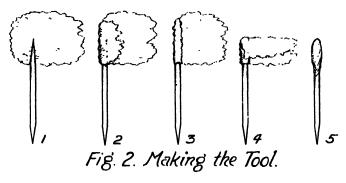

To attempt a coloring on a glossy print is a waste of time and materials. The surface of your photographic print should be matte, for matte has an affinity for photo oil color. There are many excellent matte papers available, but for reasons of space economy we list but three: Kodak Opal G, Ansco Cycora, and Defender Velour Black.

Print Quality

We cannot over-emphasize the importance of print quality, for color applied to a dim or fuzzy print only increases the obscuration of the detail and modeling. Avoid prints with extremes of light and dark areas, and favor those that are crisp, sparkling, and show a nice stepping from highlight to shadow.

Tools and Touch

Tools with which to apply color to the print are simple and inexpensive. The principal requirements are a box of round shaped toothpicks, half a dozen orange sticks or wooden skewers, and a supply of the better surgical cotton-wool. To make the average sized tool, shred out a thin piece of cotton-wool about three quarters by one inch, and lay it on the left forefinger and thumb. Now place a damp toothpick on the pad as illustrated in Fig. 2,

1, fold the pad over the toothpick, see # 2, and roll firmly to the right a bit, see # 3. Lap the upper part of the pad downward, and continue rolling the toothpick to the right, see # 4. This will give you a tool similar to that shown in # 5.

For larger sized applicators, Fig. 3 C, increase the size of the cotton-wool pad, and for very fine tools reduce the cotton to a mere wisp. Practice making the tools until you are fairly expert, and see to it that they are neatly and firmly made. For large backgrounds and other masses, the colors can be applied with swabs as shown in Fig. 3, D and E. These are made by twisting short rope-like lengths of cotton and then kinking them into a pad. It is advisable to slightly blunt the points of the toothpicks and skewers before making the tools, as this obviates the danger of scoring the print.

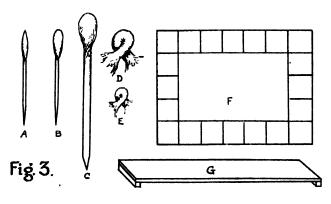

A palette on which to mix your colors can be made from a piece of window glass, size about five by seven inches. Mark off a piece of white cardboard as shown in Fig. 3, F, and attach to the back of glass with Scotch tape. Colors are squeezed onto the squares and mixed on the main part of the palette. A wooden hand rest, see G, is very useful as it allows the colorist to color his print without smearing those parts already worked on. It should be of hard wood, about twelve by one and one half, by one quarter inches, to which are attached end pieces one quarter inch high. Finally, have a roll of masking tape on hand with which to attach the print to a piece of heavy cardboard, as this keeps the print flat and easy to work on.

As for "touch," or technique, the rudiments of applying the color can be stated quite simply. Rub—don't scrub—the colors in with the right sized tool or swab, and smooth off excess paint with a feathery, circular

motion. Avoid the slightest trace of blotchiness, and see to it that none of the nice modeling—or detail—in the print is obscured by too much paint. Remember, if you apply your paint too generously, most of it will eventually have to be removed when you smooth off with a swab.

Print Tone

If your subject is generally cool, such as winter or summer landscapes and seascapes, use a grey print, but if you hope to impart warmth and glow into a fall scene, or portray living flesh tone in portraits, you must have a warm — or sepia — print.

The Paints

The first requirement in a photo oil color is, that it be intense and full bodied. One manufacturer features color kits with each color marked Lip, Cheek, Tree Green, Sky Blue, etc. For the beginner this might be an excellent idea, but it necessitates having many colors on your palette. It is the writer's measured opinion that the sincere colorist will more quickly learn the fundamentals of color mixing if he confines the palette to the ten colors in the hue circle described, and four or five special colors for flesh tones. Kodak Flesh is especially good for women and children, while Marshall's is equally good for masculine portraiture. In procuring your photo oil colors, make your choice from products that have enjoyed popularity and prominence.

Models

An artist would never dream of painting a scene or a portrait from memory. Neither should the photo colorist. Compile a portfolio of colored pages from slick periodicals such as the *National Geographic*, that show landscapes, seascapes, rocks, clouds, sunsets, etc., and portraits of all kinds. Use these as models for your colorings, and dispense with the dubious advantage of color harmonies made "out of one's head."

There you have an outline of the "Significant Seven." To have included a dissertation on how to make certain colors and how to apply them, however, would entail considerable detail and a measure of confusion as the various companies who market photo oil color kits use different colors and color terminology. For this reason, then, we

suggest reading and studying the instructions enclosed with the kits, most of which are simple, interesting, and decidedly helpful. Too, for those who wish to further their proficiency in this self-expressive hobby, there are manuals and literature available at any good photographic supply store.

Coloring with photo oil paints is an exciting and educational hobby. The medium is unusually flexible and productive of extremely smooth results, and, it is amazingly economical.

Johnny Appleseed's Correspondence

DEAR MR. APPLESHED:

It has become my job to take black and white pictures of various events in a local church and to make them into slides for projection. Since I have never made slides I was wondering if you would be kind enough to tell me something of the procedure.

The camera which I plan to use is a 4 x 5 Speed Graphic, and these negatives would have to be reduced to approximately 1 x 114.

Your help is greatly appreciated.

Edna J. Schneider

DEAR MISS SCIENCIDER:

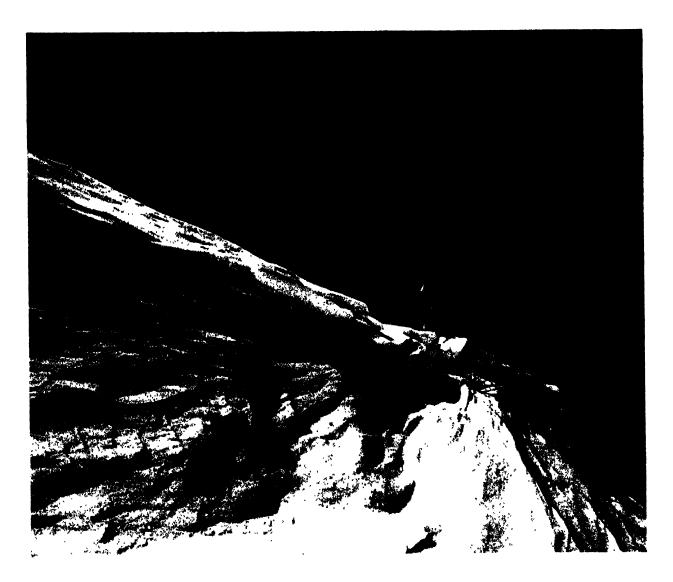

There are two relatively easy ways to take care of your problem: you can either make a paper print and copy it, or you can illuminate your negative from the rear and rephotograph it in the desired size. Let me tell you more about each of these methods.

Depending upon the equipment you have available, you may find this the easier method of the two. Make a black-and-white print on glossy or some smooth-surface paper stock. This print should be normal to slightly below usual contrast, definitely not contrasty. Mount the print to hold it rigidly, illuminate it evenly to avoid reflection (this means the light must hit the print from the side) and rephotograph on a film that will give a positive image directly. This means that you should use one of the black-and-white reversal films that are available in 35mm width or you can use Kodachrome, Ansco Color, or Ektachrome. I have used Kodachrome very successfully. As a matter of fact, PSA has available for loan through the Pictorial Division a set of Kodachrome slides made of famous black-and-white prints by this method.

Another alternative is to fix up an illumination box on which you can place your negative for camera copying, using conventional black-and-white film materials. You can make such a box by coating the interior with dull white paint and then by mounting two or three light bulbs inside the box and placing a piece of diffusing glass on one side. Tape your negative to the glass, cut off all extraneous light by using a black paper of the type packaged with sheet films, and rephotograph the negative in a room of low illumination. For your negative material on which the new positive will be made, you can use a fine-grain film, and your development should be with a fine-grain developer like D-76 or Microdol. Depending upon the contrast in your original negative, the film you use, and the developer, you will find it necessary to alter your development times from the standard recommendations. I suggest that you start with half the usual time.

Both of these procedures call for making the final copy in a camera for which the field is definitely known. This means that you should use a view camera, if possible, and that you may wish to employ a 35mm adapter back of the type described in Column No. 18, page 457, of the July 1951 JOURNAL.

JOHNNY APPLESEED, APSA

THE DAY AFTER Dr. Robert F. Edgerton

The Stereoscopic Art-Part 3*

J. A. Norling, APSA

Dual Images on One Film

Systems for stereoscopic films using dual images side by side or one above the other have also been proposed. One of the problems in the two-image arrangement, whether in tandem or side by side, is the loss of light, because the light-covering circle covers a large area around the area occupied by the two images.

The ordinary circular light spot from the projector arc spills light all around the images. This condition can be improved upon by a light condensing system having a cylindrical lens element. Then the light spot becomes oval instead of round.

A light-condensing system that improves the light distribution to dual images.

The Newcomer Anamorphoser

Another method is to introduce an optical device on the camera to compress the images in one direction, and a similar device on the projector to expand them back to normal proportions. Such an optical device is called an "anamorphoser." Several types have been constructed, but it remained for Dr. H. Sidney Newcomer to design one that does not introduce serious aberrations and have

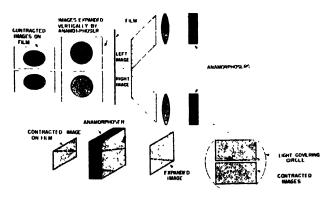

Diagram of the "Anamorphoser" principle applied to motion picture stereoscopy.

other optical handicaps. The Newcomer Anamorphoser is capable of effecting a compression of the image to almost $\frac{1}{2}$ and an expansion of almost $\frac{1}{2}$ times.

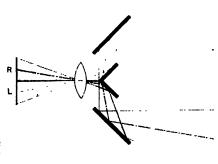

Diagram of one arrangement of the "beam splitter."

The Beam Splitter

Among the methods suggested for the employment of a single film to carry the two images is the "beam-splitter" in one form or another. The device has two pairs of mirrors (or prisms) placed in front of the lens and arranged so that the pair on the left will cause the left-eye image to be selected for projection to the screen and the right-hand pair will do the same for the right-eye image. It is a simple device and easy to use.

The beam-splitter is a device that does exactly what its name implies; it splits the light beam into two parts. Hence, the intensity of each part cannot be greater than half of the whole beam. But in addition to light loss, it has another drawback. The pictures overlap considerably, making it impossible to mask them to a stereoscopic window. The window must be artificially produced by a black border on the screen to absorb spill-over light. Another shortcoming: The camera lens works at something less than half the f/stop setting shown on the lens. This means more than twice the amount of light required for conventional photography. When it comes to shooting interiors, this added light requirement proves to be an economic disadvantage of the beam splitter method. There is a corresponding light loss in projection, and here the loss is even more significant. Take the loss inherent in the beam splitter, add that to the loss in polarization and you find that you're getting about one-twelfth the light that you had when you projected the full frame in the conventional way. Another disadvantage of the ordinary beam-splitter is the picture proportions it gives—a narrow and tall picture, certainly inappropriate for stereoscopic representation which is so well suited for panoramic views.

Another proposed device has dual lenses producing pictures side by side. There is no light loss in the camera,

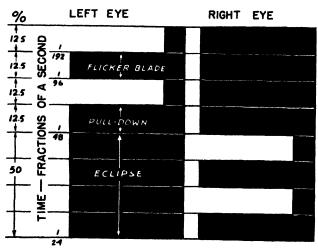

^{*} Continued from page 742, December 1951 PSA JOURNAL.

since two lenses are used and the window for each picture is quite sharp. However, there is considerable loss in projection if the attachment is used on a projector not provided with a special condenser system. If the standard proportions are retained, each image is less than one-fourth the area of the full frame.

Another method which has been proposed for simultaneous projection, is the arrangement of images with one member above the other. Special projectors would be required.

Sequential Frame Projection—"Eclipse" System

From time to time, the alternate projection of the members of a stereo pair has also been proposed. In this system, the right eye image, for instance, is projected first, then the shutter interrupts the light beam while the film moves down to position the left eye image. Thus there are periods of flicker that occur at different times for each eye. If we break this sequence of events down, we find that the first light period has a value of 12.5 per cent

The light and dark periods in "eclipse" stereoscopic projection.

of the complete picture cycle. The flicker blade on the projector shutter (considering a two-bladed shutter) gives a dark period lasting 12.5 per cent to be followed by a light period of the same, then a long dark period consuming 62.5 per cent for pull-down and eclipse to permit the other eye to see its image. If standard sound-film speed of 24 frames a second is used, the resulting flicker is very annoying. Stepping up the projection to 48 frames a second increases flicker frequency twice, but it still is noticeable. There is a physiological effect that is likely to become disagreeably apparentusually headache or nausea---after a few minutes of viewing pictures projected in this way. A complete period of darkness for one eye, while light reaches the other, will probably always result in visual fatigue, if not in nausea, no matter how high, within workable limits, the flicker frequency is brought.

Flicker of low frequency calls for traction on the control muscles of the irises when bright light enters one or both eyes. The rapid occurrence of the transmission of stimuli, first from one eye, then from the other, and the motor messages from the brain to the muscles, delivered in rapid sequence, probably accounts, in part, for the

visual discomfort experienced by most people when viewing "eclipse" stereo movies.

Perception of flicker depends upon the intensity of the interrupted light, as well as the flicker frequency. The more intense the light, the higher the frequency must go before flicker fusion is attained. Also, the larger the angular field over which flicker is distributed, the greater the consciousness of flicker. Hence the dimmer the picture and the smaller it is, the lower becomes the flicker fusion frequency.

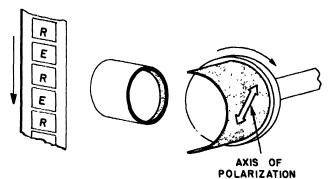

Diagram of the "rotating polarizer" method of alternate frame stereoscopic projection.

There are two ways to project and view eclipse stereograms. One is by using rotating or vibrating shutter devices held up in front of the eyes. These are synchronized electrically with the projector. The other method is to employ a rotating polarizer in front of the projector lens and polarizing spectacles for the viewer. In one position the polarizer delivers light through the left spectacle filter, in the other through the right filter.

Alternate frame, or eclipse, projection should have at least twice the number of frames required for conventional films. That means doubling the length and providing for faster projection speed. If the alternate frames are photographed alternately, there is a very objectionable fringing in pictures of moving objects. This is a cause of eyestrain, especially in a picture where the action seen by one eye is in quite a different stage of progress than the action seen by the other. Difficulty in fusion invariably results. This combination of disturbing effects caused by flickers out of phase between the eyes and by fusion trouble, limits the appreciation of the eclipse method.

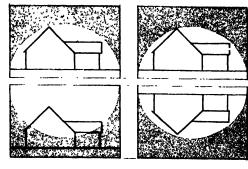

Complete visual comfort can be attained in stereo movies only if the two images are projected simultaneously, if they are rock-steady, if they are of equal brightness, if they are of equal contrast, if they are properly aligned vertically and horizontally, if far distant points are not separated too far in one image from that of the other, and if they are of exactly the same size.

Improved Single Film Methods

Several inventions by the author eliminate the draw back of the single-film dual-image arrangement, namely the unequal distribution of light. These methods employ novel optical systems which are accessory attachments to standard projector heads.

If one member of a stereogram has even a slightly different brightness, some eyestrain will result. If the difference is large, the resulting eyestrain will be great. This is because the action of the eyes' iris diaphrams is entirely automatic and not by voluntary control. If strong light falls on one eye, both pupils will contract and the eye seeing the darker image will have its pupil closed down more than it should be properly to see the image. In accommodation too, both eyes act together and it is impossible for one independently to accommodate to a different extent from the other.

Illustrating the distribution of light over a pair of images. Left—as in an arrangement wherein both images have the same position. Right—as in an arrangement

wherein one image is "flipped over" in relation to the other.

The improved single film methods satisfy one of the basic requirements for good stereograms, easy to look at, in that both members of the pair are of the same brightness. The illustration shows a pair of pictures having image attitudes in a conventional arrangement. The diagram on the right shows an improved arrangement. It affords the best possible distribution of the light from the projector arc.

The illuminating spot from the arc is considerably more intense in its center than in its outer regions. With images having the attitudes shown in the left side diagram, more light falls at the top of one picture than at the top of the other, resulting in a different level of illumination in an area of one than in the corresponding area of the other. The arrangement shown on the right provides equal illumination in corresponding areas, because all portions of the light spot fall upon the same corresponding areas in each member. This meets the requirement that there be equal brightness for each image in order to attain complete visual comfort. It may seem surprising that the intensity difference between center

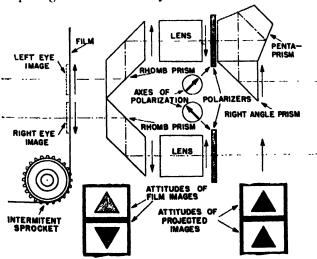

Diagram of an improved optical system for simultaneous projection of the two images comprising the stereoscopic pair.

and edges of the light circle is significant. Actually, in practice, projection engineers are quite happy if there is only a 40 per cent loss,—60 per cent as much light at the edges as in the center. In many theatre installations, the fall-off is as much as 50 per cent.

The projection end of this system, using standard projector heads, has two optical trains containing prisms as well as lenses. These components are arranged so that the light beam enters and exits normal to the prism surfaces and there is no displacement or distortion such as would take place with wedge prisms. Alignment of the images on the screen is effected by a micrometer control to shift the lenses. In the lower optical train, transmitting the right eye image (the one having the conventional attitude), the image passes through in the conventional manner, reversing to "heads up" in the projection lens. In the upper optical train, transmitting the left eye image (the one having the "flipped over" attitude), the image is brought to conventional attitude in a pentaprism and right angle prism forward of the lens.

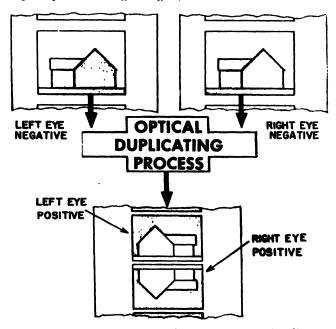

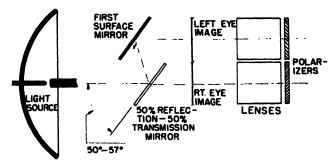

Diagram of transfer of images from the two negative films to the single film carrying the two disparate images.

The polarizers are placed in front of the lenses away from the intense heat.

Prints for this system of projection are not made directly from the original negatives. Duplicate negatives produced in an optical duplicating process are used instead.

Another improved single-film method has the images turned on their sides. This arrangement provides for the use of the full standard aperture in case the pair of images is to occupy only one standard frame. A series of prism elements between the film and the lens turns these images 90°. The inverted image is "flipped over" in the pentaprism and right angle prism in front of the lens. Otherwise, the practical advantages of this variation are comparable to those of the method which is discussed in the preceding few paragraphs.

Another method, devised by the author, for attaining equal illumination for both members of the stereoscopic

Illustrating an arrangement that provides equal illumination for both images by using a partially transmitting mirror.

pair is also illustrated. Here, there are two mirrors arranged between the light source and the film. The lower mirror is a transmission-reflection type, with a reflective coating that will reflect half the light to the upper mirror, one-half the light passing through to one member of the pair. The upper mirror reflects one-half the original light beam to the other member. Again, two projection lenses are used, as in the other systems with the polarizers in front of them.

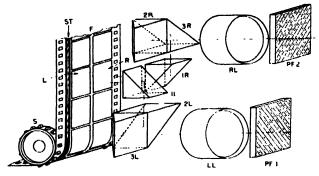

Diagram of improved single-film method with the images turned on their sides.

In this system the images do not have to be inverted in relation to each other, since the illuminating circle falls upon the same corresponding area in each. The lightcircle can be reduced in size to fit the area occupied by one frame, adding efficiency. Added efficiency also results from the reduction in the number of glass-to-air surfaces. Additionally, there is less possibility for dirt or "fogging" on the optical elements. In contradistinction to the other methods, which require no lamphouse changes, this method does require a few changes in the lamphouse to accommodate the two mirrors.

A dual-image single-film does not add significantly to print costs, to the costs of studio production, to shipping and handling costs between exchange and theatre, nor does it require dual projectors and added labor costs for projection. This single projection method does not introduce the unwanted possibility of images out of synchronism with each other, a hazard that exists in dual projection. It assures precise registration, one image with the other. Alignment is no problem, since both images are framed together by the same frame-setting lever. There can be no jiggling or jittering between the images such as is present in any dual system no matter how well made the projector mechanisms.

OTHER STEREOSCOPIC METHODS

The Friese-Greene Process

The first stereoscopic motion picture was made by William Friese-Greene who patented his process in 1893. He used two negative films, one behind each lens. The positive images were projected side by side on a screen and viewed through a cumbersome stereoscope permitting each eye to see only the picture intended for it. The complexity of this system barred it from any commercial application.

The Grid System

The grid system has been frequently proposed and a large number of variations on the basic method have been suggested during the past 40 years.

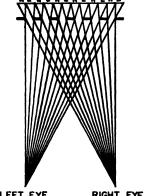

Diagram of the fundamental "grid system" of stereoscopy. LEFT EYE

RIGHT EYE

Basically, the grid system employs a screen containing a large number of vertically placed parallel opaque bars forming a grating having open or transparent spaces between them. This grid is placed some distance in front of the projection screen, the grating in the grid being designed so that the right eye sees only that portion of the screen on which the picture record for the right eye appears, the bars in the grating hiding the left eye image from the right eye. It does the same thing for the other eye.

The chief problem in using the grid system is that the observer's viewing distance, angle of view, and of eye placement in relation to the grid are of a fixed interlocking relationship. Disturb one of the three and proper viewing fails. A slight shift to the right or left results in the breakdown of "correct individual seeing" for each eye, and a double image become apparent, or else a pseudoscopic effect results. Improvements have been made on the basic grid system, but serious shortcomings still remain as an intrinsic part thereof. This particularly applies to the loss of light. While a light loss is common to all stereo projection systems, it is particularly severe in this one, due to the fact that the opaque areas in the grating have to be (in most cases) about three times that of the open areas in order to keep the images from overlapping.

Another matter that must be given consideration is the appearance of the grating to the observer. The dark bars and light spaces should be small enough to be virtually invisible as a banded pattern. To make the grating lines invisible, the spacing of the elements should be no larger than about 1/3500 of the viewing distance.

We shall call the grating space G₈.

Then

$$G_s = D_v$$

3500 (or more)

Where D_v is the viewing distance.

Thus, if $D_v = 60''$, $G_s = .0175''$, approx.

And if $D_v = 120''$, $G_s = .035''$, etc.

The distance, d_g , of any selected grating in front of the screen depends on the relationship of the distance D_v to d_g , or by the relationship of I to D_v .

With the usual grid system, the picture through the grating is viewed by converging the eyes at or near the grating, forming an angle. In order for the grating effectively to select the images properly for the eyes, the disparate members of the stereoscopic pair must be projected through the grating at the same angle.

The New York *Times*, early in 1944, reported that Simyon Ivanov, a Soviet poster artist, had invented a screen made up of tiny squares of thousands of strands of fine wire which produced third-dimensional effects without the use of eye-glasses. James Aldridge, writing on the same subject for the North American Newspaper Alliance, reported that the images reproduced through the screen were "coarse and blurred."

The article goes on to say that the original Ivanov grid system had been improved and developed in the Sgvintorgkino Studio to the point where it promised to become practicable. To quote from the article:

The glass screen is engraved with more than 2,000 converging lines, and it is in these markings that the secret of the new screen lies. In photographing third-dimensional movies, the only alteration required on standard cameras is the addition of two or more mirrors fitted near the lenses to reflect the images onto the film.

Obviously, this appears to describe Ivanov's photographic process as being an application of the beam-splitter principle.

The article goes on to say:

In showing the film, it is projected onto "two or more mirrors," instead of directly onto the screen, which reflects the shadows onto the glass screen. In turn, the lines on the screen unscramble the images, resulting in a clearer image than has hitherto been obtained in third-dimensional film experiments.

Then, in October 1945, the Wall Street *Journal* reported further on the Ivanov development:

Moscow (AP)—The Soviet film industry is preparing a surprise for the world's movie fans—a special production of Robinson Crusoe to be exhibited on a new stereoscopic screen designed to give rounded, three-dimensional images.

Semeon Pavlovich Ivanov, the inventor, said that the screen creates an illusion so perfect that people unconsciously dodge when pictures of birds or airplanes are shown.

Ivanov said he believed the screen surpasses anything Hollywood had done to achieve realism in the exhibition of motion pictures.

On April 29, 1948, the New York *Herald-Tribune* published the following:

Moscow, April 28 (AP)—The Communist newspaper "Pravda" disclosed today that Semyon P. Ivanov, described as the inventor of three-gimensional motion pictures, had been removed from the job of scientific chief of the special studio in which he perfected the invention.

The newspaper (Pravda) said that I. Bolshakov, Motion Picture Minister, did not take Mr. Ivanov's work seriously, tried to picture him as a faker and publicity seeker and finally pulled him off with the excuse that he was freeing him from his administrative duties.

Pravda went on to state:

That's how the cinema industry freed itself of the worrisome individual whose name will go down in the history of the Soviet and world cinema.

Truly, workers on the grid method of stereoscopy have a bad time when someone eventually discovers that the images don't appear satisfactory throughout an auditorium.

Parallax Stereograms

Parallax stereograms are of two principal kinds, one using a grating, or "grid" as the selecting screen placed in front of the images, and the other using a selective screen consisting of small cylindrical lens elements, lenticules, side by side, and running vertically.

The "grid" system was introduced by Berthier in 1896 and was the first form of stereoscopic viewing of still pictures that did not require accessories. The grid consisted of vertical bars with spaces in between. The grid was usually made on a high contrast photographic plate. The picture was a composite which had the two images broken up into bands, the image bands for one eye being interlaced between the image bands for the other. When the grid was spaced at the prescribed distance in front of the composite and viewed from the correct distance, the observer was able to see a binocular view.

The "lenticular" system used a selective screen sometimes registered in front of the images; sometimes directly bonded to the composite photograph. The lenticules do not cut down the reflected light as do the bars in the grid system. In one system, the composite picture is made in a single lens camera which swings through an arc during exposure. The center of the arc is in the plane of the subject.

Lenticular systems are credited to several inventors; among them F. E. Ives and his son, Dr. H. E. Ives. Dr. Ives called his the "Parallax Panoramagram." Improvements have been made and further developments carried out by the Americans, Vanbenschoeten and Winnek, and the Frenchman Bonnet.

The Zafiropulo Process

Another invention employing the lenticular principle is that of Jean Zasiropulo, who set out to apply it to the motion picture in particular. The process requires extremely accurate alignment of all elements in photography and projection.

The Zafiropulo process involves the use of a film containing embossed spherical lens elements in its base. Prints must have their lens elements exactly aligned with those in the negative. The lens elements must register with the greatest exactitude in relation to the sprocket holes in the film. Sprocket teeth, engaging the sprocket holes, serve as the basic registration points for picture steadiness. Film shrinkage, which is over 14 per cent in the lowest-shrink film base, will have to be overcome to prevent lens-element misalignment with relation to the

sprocket teeth, and in turn to prevent misalignment of the film lens-elements and the screen lens-elements.

The Zafiropulo process requires only one lens in photography, but it must be of large diameter, from $2\frac{1}{2}$ " to 3", and such a lens must be of long focus, over 6" in an f/2.5 lens. This is about 153mm compare with 40mm and 50mm lenses, which are the most frequently used in film studios. This long focus lens requires more studio space than is needed in conventional filming.

Several other methods have been proposed for the lenticulated (goffered) film process of movie stereoscopy. One is, in essence, an application of the "beam splitter" principle, differing from it in that it produces a series of bands for each image. One band, for part of the left eve

every square inch, and the plates should be quite large, 8" x 10" or more.

Exposure is made through the pin-holes, and since the effective aperture of each pin-hole is extremely small, long time exposures are essential. They cannot be satisfactorily reproduced; hence copies are not obtainable, and the negative image has to be rendered into a positive by reversal. Viewing should be with a mirror placed so that the proper left-right attitudes of the images can be obtained.

The nature of the process excludes it from practical usefulness, particularly for motion pictures, but it is an interesting thing with which to play, and can be experimented upon by anyone having the required facilities.

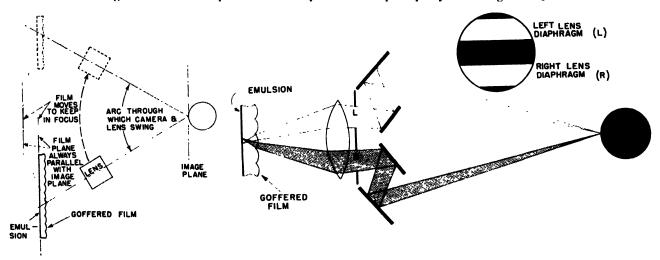

Diagram (left) of one type of camera for making lenticular stereograms. Right Diagram of one method of lenticular stereoscopy employing the beam-splitter principle with the addition of slit diaphragms.

image, is formed through each lenticule, and another band is formed adjacent to it for the corresponding part of the right eye image, through the same lenticule. The lens must be operated at its widest aperture.

Lippman's "Integral System" of Stereoscopy

The process of "integral" photography discovered by Lippman in 1908 utilized a screen composed of an almost infinite number of small "lens elements" in the form of pin-holes. It affords what most who have seen it consider the ultimate in stereoscopic viewing. It differs from any other system of stereoscopy in that it provides a much larger number of images in the plane of the photograph and "reduces the number of viewing instruments to zero." But Lippman's integral photographs can be made only as transparencies, and they cannot be projected, nor can they be reproduced to supply copies that have the qualities existing in the original.

These integrated stereograms are made through a screen having a great number of pin-holes, each acting as a camera lens. No camera is used; the pin-holes serving as lenses. The screen can be a photographic image in a contrasty emulsion on the front side of a glass plate with the photographic image produced through it on an emulsion on the back. The holes must be quite small; their size being established by the rules applying to pin-hole photography. There must be a great number of holes for

Single Lens Camera for Motion Picture Stereoscopy

If two strip stereo films are used, such things as titles can be made by exposing one image, for the required footage, then shifting the camera to expose the other, as is done in making "slide-board" stills referred to earlier in this article.

A variation of the principle can be applied to obtain stereoscopic motion pictures, especially aerial shots. The author has made such films using only one camera, and making only one negative. Two prints were made from these single negatives and projected in interlock on two machines. However, the prints were projected with one print having its frames displaced in relation to those of the other. The number of frames displaced is governed by the plane's elevation above the ground and above the nearest object, in scenes looking straight down. Frame displacement is also governed by the ground speed of the plane. A plane flying at 100 miles per hour will cover 144 feet a second, which means that six feet is covered in every second for a film speed of 24 frames a second. A full reel was made during flights over New York City, the camera pointing straight down. The plane was flown at 2500 feet, and slow-motion photography of 96 frames a second was used.

A film speed of 96 frames a second with a plane speed of 100 miles per hour gives $1\frac{1}{2}$ feet of advance along the

course as registered by every frame. Using the equation $\frac{D\times d}{D-d}\div 50$, established the base of the interaxial that would result in the most startling visual effect with the least eyestrain. The farthest plane, D, the ground; the nearest plane, d, the top of the Empire State building; and the divisor, 50, indicated an interaxial base of 40 feet and this was achieved synthetically by a displacement of one film with the other of 30 frames. Actually, a displacement of 15 frames was finally selected to give the most satisfactory results.

Some stereo shots were made up in this way from stock footage taken from a plane flying over the Andes. The plane was flying about 180 miles an hour and the exposures were made at normal camera speed. The camera pointed horizontally toward the distant mountains.

The most startling of these shots was one that included "The Christ of the Andes." This heroic statue was in the middle distance and stood out in vivid relief against the mountains beyond.

There is one thing that creates quite a problem: any unsteadiness in the airplane's flight. This comes out in the projection as a constantly changing vertical and horizontal, and sometimes rotational displacement between the images. Such displacements existed in the films we made and had to be eliminated by optical duping methods involving a complexity of steps. But it was an interesting experiment and worth the trouble.

The Vcctograph

Vectograph is the name applied to a clear plastic sheet on which an image may be rendered in terms of varying degrees of polarization, and viewed through a polarizing filter. The vectograph can accommodate an image on both its sides, and each image can be made to have its axis of polarization at right angles to that of the other. A stereo vectograph has the images of a stereo pair printed respectively on top and bottom of a vectograph sheet, and is viewed through polarizing spectacles with its respective windows having polarizing axes corresponding to those of

the vectograph images. In slide form, the three-dimensional vectograph can be shown in a standard monocular projector without filters. As in other systems using polarized light, silver non-depolarizing screens and polarizing viewing spectacles are required.

During World War II the three-dimensional vectograph was used by the armed services for aerial reconnaissance and for training personnel in various skills. Other uses for this novel, paper-thin stereo picture will doubtless be found. Its picture quality is excellent and its ease of handling and processing are distinct advantages for any photographic process,

Three Dimensional Pictures and Television

Inevitably today, any new method of visual presentation both still and motion, can be telecast. As a matter of fact, an experimental stereo-television system has been at work in the Argonne National Laboratories. It permits an operator to keep a precise watch over the "hot" materials he is handling by remote control. Equipped with a pair of viewing spectacles and with eyes glued to a pair of television screen images which are transmitted by a binocular television camera, the operator does get a three-dimensional impression. But the problems involved in presenting satisfactory three-dimensional television to the public may be so very great that, by comparison, the problems of introducing color television have been small indeed. It is anybody's guess when stereo television will enjoy a widespread audience; if the history of stereo movies can provide a clue, the time is many years away.

Non-Stereo System

A system which has recently been described as producing a three-dimensional effect is the Cinerama development of Fred Waller. This method, requiring a multiplicity of cameras and projectors, presents a dramatic panoramic view of the scene photographed. But it is not three-dimensional at all, since it does not present a mutually exclusive image to each eye, the basic requirement of any three-dimensional system. (To be continued)

Camera Club Manual

H. J. Johnson, FPSA

In the following section of the revised Camera Club Manual, we continue discussion of the problems of newer clubs.

Getting Members

First, and one of the major undertakings of a new club, is to initiate a steady, healthy growth in membership. This may be done by working hard and continuously for that goal, and with the club officers directing and encouraging, and every member helping.

The new organization can acquire members in various ways, such as:

- Informing all camera stores of the organization of the club and inviting photographers to attend. Helpful to the camera store is a card of invitation for its bulletin board, or a number of printed invitations to be handed to customers.
- Keeping the local newspapers informed of what is taking place, and enlisting the support of the editors in getting advance notices and following reports of meetings published.

- 3. Making up a list of available local photographers, and writing each a friendly letter, inviting attendance at meetings, suggesting membership in the club.
- 4. Making contacts with officials of art stores, art museums, art galleries, libraries, and other cultural centers, and stressing the availability of memberships in the club.
- 5. Inviting everyone conceivably interested to attend meetings and then, at these meetings, (a) getting the names and addresses of guests, (b) extending open invitations to join, and (c) making joining easy and prompt.
- 6. Appointing an officer or member of the club as head of a Reception Committee which will meet every guest, introduce the guest to members and to the chairman or members of the Membership Committee and put the guest in a mood of liking the club and its people and of wanting to join.
- 7. Establishing contacts with the officials of schools and other educational institutions, and informing them that advanced students interested in photography will be welcomed as club members.
- Establishing contacts with large fraternal and social organizations and informing them that members interested in photography will be welcome at club meetings.
- 9. Seeing to it that friendly, inviting notices of meetings are mailed, at least a week in advance, to all guests, and to others interested. Keep notifying and inviting these people for at least three meetings.
- 10. Conducting a photographic school which the general public may attend. The tuition fee may be applied toward the membership fee.

New members should be introduced to the club at the earliest possible moment and made welcome. Guests also may be introduced by name. (They should not be asked to introduce themselves in open meeting, a practice which tends to be embarrassing.)

New camera clubs and old alike have membership problems for which only they can find the solutions. The average club probably will not seek to be exclusive. Ownership of camera equipment, interest in photography, or personality can be adequate requirements for membership. On the other hand, some clubs may wish to have certain barriers to membership for reasons they regard as good and sufficient. Such clubs may wish to have a membership or Admissions Committee.

The more democratic the club, the easier and more rapid its growth. The more exclusive the club, the more difficult and the slower its growth. Snobbishness has little sales appeal in camera clubs.

Few clubs, except for small and exclusive special-purpose organizations, question the photographic abilities of prospective members. Many clubs have in their membership persons who for one reason or another participate only vicariously in photography.

Possibly an important question confronting some new camera clubs is whether to admit women. By and large, camera clubs new and old, decreasingly raise this question. The co-ed club is quite as successful, and its meetings much more enjoyable, than the club which restricts

its membership to either sex. Experience presents no substantial reason why mixed membership should not be sought nor, indeed, why it should not be encouraged.

Another problem is that of "junior" members. Teenagers may not be as stable in their interests as older members, but there are usually a few who maintain interest. In addition, those who drift away are potential members in the future.

Club Publicity

Helpful to the growth and activity of the new camera club is continuing and judicious publicity.

Notices of meetings should be sent to local publications several days, and preferably a week, in advance. Personal contacts of the club officer or member in charge of publicity with the local press is desirable. In this connection, the newspaper camera staff should not be overlooked. Newspaper photographers have little spare time, but they are as ardently and deeply interested in camera work as the most fanatical amateur. Their membership in the club can be a real asset.

Reports of meetings should be provided to interested daily newspapers immediately after the meeting. Newspapers in some communities will not be greatly interested; others may be more cooperative, and their friendly interest may be cultivated to advantage. Newspaper camera editors naturally will be actively interested.

Notices of meetings posted in camera stores, cultural centers, and other gathering places are helpful forms of publicity.

Less direct but of good potential value is publicity in camera magazines. Such publicity cannot be expected frequently but when obtainable it helps make the club's name more widely familiar to photographers. (Note: "Publicity" is not a once-a-year announcement of new officers by the secretary!)

In general, clubs which do not participate in outside competitions and activities are less likely to obtain fame than is one which is alert to the value of outside stimulation.

Camera Club Relationships

The new camera club can benefit by establishing friendly relationships with photographic equipment dealers, professional photographers, news photographers, and others of the camera trade, and with art groups, schools, museums, libraries, and other cultural organizations.

Many members of the camera trade personally are interested in photography, but hesitate to attend camera club meetings, sometimes because they are not invited, and again because they fear clubs or members will wish to "talk shop" with them or even will seek to obtain preferential treatment. In the trade will be found many people of excellent membership calibre who will react to friendly interest and treatment, and who may be invited to enjoy photography with the club with the assurance that the business aspects of camera work will not come up. Many professional photographers also are interested in camera club activities and frequently will participate if they too are permitted through the club to enjoy photography.

Relationships with educational institutions, art groups, and cultural centers may at first be difficult. The question whether photography is art is unimportant but long-lived and ubiquitous. The need for diplomacy is indicated, and once complete understanding is reached, the camera club may find contacts, and even joint meetings, with art groups particularly enjoyable.

Relationships between camera clubs, both new and old,

advisably may be maintained on a friendly basis. Joint meetings, exchange meetings, sharing of field trips, and other undertakings, easily are possible. Inter-club competitions within the limits of friendliness and good sportsmanship make good program features.

No club should overlook the broader relationship with clubs all over the world through membership in PSA. (To be continued.)

Anatomy of the Jace

DOROTHY E. KILMER

Probably there are very few people who are not pleased by a flattering portrait of themselves, so it would behoove the photographic artist to endeavor to minimize the defects and emphasize the best features of their subjects. This can be accomplished to a great extent by studying the anatomy of the face, and the lighting that produces the desired effect. This was an all-important part of the training of artists long before the camera came into being, and the same rules are still applicable to portraiture today.

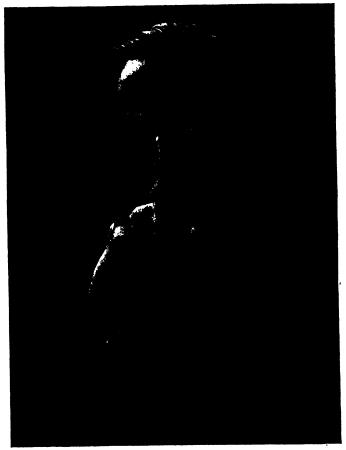

First let us consider the planes of the face: the separation between the tip of the nose and cheek, the distance of separation between the lower lip and the indentation below, and the space between the ridge of the nose and the eye. There are also the forchead, which protrudes, the upper jaw, the cheek bone, and last, the chin.

Next we have the various shapes, or contours: the square, oval, narrow and full face. This gives the general shape of the head which we must study in order to light it to the best advantage. There are no perfect faces, but with corrective lighting, some can be made to appear almost perfect—these we call photogenic.

Let us first study the nose, as it is more difficult to subdue than any other feature, and the cast shadows can distort the entire face. Do not highlight a nose or it may appear to be broken. Turn the head until you find the nose to be straight with the face lines, then take care in raising and lowering your lights, to control the shadows. Use a lower camera angle for a long nose, and be careful to avoid a shadow directly beneath it, as that would tend to increase the apparent length. A thin, straight nose is not so difficult, but be sure the side is well lighted, as this will make it look a bit larger.

A flat nose is portrayed best when flat lighting is used, especially in the case of very young babies. A broad nose will need retouching, as strong lights on the sides will make it look larger than ever. This type has flared nostrils, and you cannot eliminate them with lights. However, you can help to reduce the apparent size of the nose by having one side in shadow.

Eyes—"the windows of the soul"—are the most expressive part of the face, so they must be carefully lighted to bring out their best points. Deep-set eyes require a low camera angle and floor-level illumination, so they will not be in too much shadow. Try to light for emphasis, but do not overlight. When you have finished a portrait,

ERNEST THESIGER

Karl Pollak

cover all but the eyes, and see if they show interest and personality. This is the best test for the success of your efforts.

Try to have your subject relax the muscles of the mouth, as a tenseness will cause an unnatural expression, thus spoiling an otherwise excellent likeness. Use of makeup on thin lips, care in posing and proper lighting can do much to correct faults such as a narrow mouth, protruding lips, and dropping lines around the mouth.

Careful study of your subject, and special attention to defects that can be minimized by proper lighting and camera angle will do much to improve your portraits. Emphasize the most attractive features, and the results will be extremely gratifying.

BOOK REVIEWS

SUMMER'S CHILDREN, A Photographic Cycle of Life at Camp, by Barbara Morgan, Morgan & Morgan, Scarsdale, N. Y., 160 pages, 8½x10, illustrated, cloth, \$5.00, 1951.

Photographers who wish to study the modern technique of "writing with photographs," and grown-ups who desire to live again the delightful camp days of youth, will find enjoyment and satisfaction in this book. Students of child and camp psychology will like it, too, for the words of Dr. Mary Fisher Langmuir and Helen Haskell make it that. Even the author barges into the technical when she explains that she views the volume "as an affirmation of the art and science of human relationship" and a seeking for an "improved quality of life."

Once the reader has leaped the dismal barrier of scientific jargon which opens the book, a new and enjoyable world of big pictures and small words is shown in photographic panorama. Here are exquisite photographs of child life at camp, with children looking, acting, and talking like real moppets, not specimens.

All of camp life is here—the barn, the horses, and kindergarten equitation; the lake and boating; the animals, wild and domestic; the nature study classes; the hike, with dinner al fresco in the chasm or on the mountain; the cabins, tents, and bunks; the parents' visit; the girl who can turn cartwheels and the fat boy who cannot.

And then the author, praise be, has included a chapter, "Hocus Pocus Dominocus," which presents many of the mystic poems and sayings of childhood. Plus stories and pictures about the goat who ate the mail, the horse who ran away, and other interesting characters essential to any camp which is a camp.

This is a book for photographers and for adults. And the more serious and aged they are, the more they need it. Not merely a book, but a contribution to the real enjoyment of life.

Photofacts, Volume Two, edited by George L. Wakefield, The Fountain Press, London, England, 392 pages, 43,4 by 7, illustrated, cloth, \$4.75, 1951.

This volume combines the information previously published in the separate "Photofacts" booklets on darkrooms, film development, contact printing, enlarging, print development, holiday photography, outdoor lighting, and lantern slides. The editor explains that it deals with established photographic techniques, presenting the tried-and-true formulas and methods of experienced photographers, avoiding fads and novelties.

Both beginning and advanced photographers will find the book helpful because of its thoroughness, and also because of its constant striving to guide the reader to making thoroughly good pictures. Many photographs, used as illustrations, make the volume additionally interesting and informative.

Photographers planning to take a camera jaunt will find the section on holiday photography particularly helpful. While it would seem as if such photography were a matter merely of packing the camera gear and setting off, there's much more to it. And most of the much more is presented herein.

NEGATIVE FAULTS AND HOW TO CORRECT THEM, Photofacts No. 23, and PRINT FAULTS AND HOW TO CORRECT THEM, Photofacts No. 24, both by Frank Harris, The Fountain Press, London, England, 40 pages, 444x714, illustrated, paper, 50 cents each, 1951.

These two books summarize the common shortcomings of negatives and prints; tell how to rectify them, when possible; how to avoid them in the future. The recommended processes are long-established and simple. The reader is encouraged to undertake the remedial processes without fear that they are too difficult. Good, solid advice for the amateur who wishes to become the complete and competent photographer.

PHOTOBIOGRAPHY, by Cecil Beaton, Doubleday & Co., Garden City, N. Y., 255 pages, 7x10, illustrated, cloth, \$6.00, 1951.

Many photographers have written books, and many books have been written about photography, but none before like this. It is all photography, every word and picture of it. So fascinating that the photographer who starts to read it probably will lose family, friends, meals, and whatever before he puts it down!

Cecil Beaton is--if any do not knowan English photographer who started as a boy with a box camera, promoted himself to a 3A Kodak and a tripod, and then, with no other equipment, worked himself to fame and fortune as portraitist, fashion photographer, and illustrator. In this volume he tells how he did it--by making photographs. Granted he was art sensitive from the first. That he had some art training and undertook theatrical design. That he had art imagination. Yet the secret of his success in photography appears to be that he made photographs and photographs and photographs until the results satisfied him. Then he made photographs.

Well along in this intriguing volume, after Beaton has told how Conde Nast forced him to forsake his 3A and to use a studio camera, and after a friend had sold him on the virtues of a Rollei, he explains that he makes 500 or more exposures on one assignment. He admits that his technical abilities may be weak. Others develop his negatives and make his prints for him. But still Beaton insists he makes photographs, and good photographs, be-

PSA CONVENTION

New York, New York, August 13-16, 1952

cause of his insatiable curiosity about people and things.

As a boy he posed his mother, sisters, friends, and family servants for as long as they would stay put. Later he virtually wore out models, posing them in bowers of artificial flowers, clouds of cellophane, backgrounds of fantastic textiles, baroque settings. He worked days, nights, holidays, summer, spring, winter, fall, indoors, outdoors—making photographs.

The investment of time and energy paid off. Beaton became the photographer of the great. His sitters have included the British royal family, Churchill, Halifax, Gertrude Stein, the Duke and Duchess of Windsor, Andre Gide, Katherine Hepburn. Marlene Dietrich, Gary Cooper, Eleanor Roosevelt.

He photographed the war in England, Africa, Libya, Egypt, Burma, India, China, and the United States. 'For six months," he explains, "I took hundreds of photographs every week." And once again his persistency and curiosity paid dividends. He received commissions for making photographs which others could have done better, technically. Evidently he did well enough for "Vogue" magazine gave him a roving commission and a five figure salary and turned him loose to photograph fashions, people, events, scenes, things almost as he wished.

Even then the 3A complex has persisted. His portraits customarily are made with strong overhead light, weak reflected light on the face, and a "hot" backlight to produce a halo—with the result that sitters repeatedly complain of scorched derrieres. And he has had a wonderful time, making an experience of every sitting, and expecting every film to provide him with a legacy. Many of his delightful experiences are recounted in the book. Including the time he kept a dowager waiting while he borrowed her sequin wrap for Katherine Hepburn posing as Joan of Arc in coat-of-mail.

This is only one of many books Beaton has written and illustrated with the camera. It is to be hoped it is not the last. For this is a breezy, fantastic, swashbuckling tale of an irrepressibly gay photographer who sees every photographic rule and tradition as something to be ignored, trampled upon, or smashed—and who succeeds marvelously with this process.

P. S. He admits that the rules must be known before they can be broken successfully.

We are requested by Allen R. Greenleaf, author of *Photographic Optics* (New York, The Macmillan Company, 1950) to state that he did not approve recent direct-mail advertising to PSA members that claims (1) that the book supplies "information on the construction, merits, and deficiencies, of all photographic lenses"; (2) that "He gives specifications and drawings of all types of lenses, . . ."; (3) that "It explains . . . the properties, construction, merits, and deficiencies of ALL photographic lenses being manufactured today."

PSA HONORS

JOHN W. McFarlane

Ex-Chairman, PSA National Honors Committee

"I have just received the good news and hardly know what to say. I didn't know I had been proposed for the Honor." This was typical of most letters from those elected to Honors this past year and illustrates the way our Honors procedure is meant to work. The system now functions as it should-"Honors seek the man and not the man seeks Honors." It used to be that some deserving candidates were passed by unless they proposed themselves which very few people will do. The establishment of Divisional Honors Proposal Committees has made sure that no deserving candidates will be overlooked. The type of candidate respected most by the National Honors Committee is the one proposed without his action, and handled by the Divisional Committee.

PSA Honors are just what the word implies. They are not grades of membership nor are they simply certificates of photographic proficiency. They are tokens of worthwhile advancement of photography and assistance to fellow men. Our Honors are at a high level and will continue to be kept there. Undoubtedly, a 1-w mistakes have been made in the past but as far as possible the Honors Committee will uphold a high standard which will reflect credit on the one honored and on the Society.

Four PSA Honors were established some years ago. The Associateship is awarded for really worthwhile advancement of photography in any field. The Fellowship is awarded for outstanding advancement of photography, usually accompanied by extensive public service. The Honorary Membership is awarded for outstanding organizational work for PSA. The Honorary Fellowship, the highest honor, is awarded sparingly and only for the very highest level of achievement in advancing photography. The Honorary Fellowship can be awarded to nonmembers.

The Search Mechanism

Relax! If you rate an Honor, it will certainly be found out and you will be proposed for the proper Honor. Honors Proposal Committees have been established for each Division and the names of their chairmen are given below. The principal function of these Committees are two-fold:

- To make a thorough search for any deserving candidates.
- To assist any proposer in the preparation of a suitable application.

In the search for candidates, the District Representatives and the directors of various Divisional Committees should all assist in pointing out to the Divisional Honors Committee any candidates they think should be considered. In general,

the Divisional Committee itself will not prepare applications or act as proposer. although when necessary they can obtain a proposer. They will review applications and make suggestions to the proposer for improvement of the application. The Proposal Committee will also convey to the National Honors Committee their opinion of the worthiness of the candidate. The Proposal Committee, however, has no power over any application, i.e., they can not veto any application or prevent it from reaching the National Honors Committee. The National Committee naturally values the opinion of the Divisional Committee but is not bound by it either in electing or rejecting a candidate. It must be repeated that Divisional Committee is not a screening committee, that their main functions are those of search and assistance.

Applications can go directly to Headquarters without going through a Divisional Committee. This is not usually in the best interests of the candidate. A number of poorly prepared applications were received last year which had not received the benefit of the Divisional Committee's consideration. Some candidates may not have been elected for that reason. In any case, the Honors Committee is always curious to know what motive was behind avoiding the Divisional Committee.

So You Want To Propose a Candidate

First of all, don't tell him. In nearly all cases you can get sufficient information about his or her record from friends, wife, secretary, camera club record, etc. If you do tell him you are running a risk of considerable embarrassment if he is not elected.

Talk it over with his PSA friends who share your opinion that he should be honored. Get two PSA members who are not only willing but anxious to serve as endorsers. If you have to twist a man's arm for endorsement, the Honors Committee will hear him yell. In any case, it is your duty to get two endorsers who will promptly return the confidential endorsement on the form which they will receive from Headquarters. It is almost fatal to the candidate's chances to name anyone as endorser without securing his consent. Several candidates were not elected last year for this among other reasons.

When you write up your candidate use the new form, that is the revised 1951 form. Get a copy from your Divisional Committee or from PSA Headquarters. Read the instructions. Get the application typewritten if you can. In giving information, don't assume that the candidate's work is well known. Technical members

of the Honors Committee may not be familiar with a pictorialist's achievements. On the other hand, don't go into fine details. A detailed list of salon acceptances is definitely not wanted and it looks like padding. You should be able to give the candidate's record in the two pages provided. Additional material, except in unusual cases, probably will not be circulated to all members of the Honors Committee. Just remember that eight copies of everything will have to be made. Only the stuff which is really worthwhile is going to be copied. Don't send prints, clippings, and the like unless you are asked for it.

Send the application to the Divisional Committee Chairman at address below. If you have good reason to do so, you can send it directly to Headquarters for forwarding to the Honors Committee. Observe the deadline and just remember the application will get more careful consideration from the Divisional Committee if you send it in considerably before the deadline Your deadline is March 1st no matter which way you route the application. If your application doesn't arrive on time or it your endorsers do not return their endorsements within the time requested, the application will probably be held over until the following year. Such applications will not be forwarded to the National Honors Committee.

If Your Candidate Is Not Elected

Elected candidates are notified directly. In the case of those not elected, the proposer but not the candidate is notified.

If you do get a letter from the National Honors Committee Chairman that starts out "It is my unhappy duty . . ." don't pout and start throwing things. Either the application was poorly prepared or your candidate just doesn't have enough achievements to his or her credit. Don't send in the same application next year. It is better to wait a couple of years so that additional achievements can be cited.

All of this sounds as though we are inviting a large crop of Honors applications. We are not. Most of the backlog of deserving candidates was caught last year. We do want to have any deserving people honored, but their number should not be great.

How Not To Get An Honor

- 1. Join PSA just to get an Honor.
- Propose yourself and don't hother about endorsers.
- Use bribery or threats on your endorsers.
- 4. Use an old application form.
- Ignore your Divisional Honors Proposal Committees.
- 6. Don't read the instructions.
- Write the application in a longhand, illegible scrawl.
- Add 15 pages of details including your first double exposure with a box camera.
- 9. Send the application in late.
- 10. Send gifts to the Honors Committee. (Brother, if you get an Honor, we give up!)

THE PHANTOM SHIP

Karl A. Baumgaertel, APSA
The correct position of the plate that appeared on page 681 of the November 1951 PSA JOURNAL up-side-down. This is a
reflection purposely inverted to make an abstraction. Our sincere apologies to Mr. Baumgaertel for the error, which we are
pleased to correct herewith.

Divisional Honors Committees

Chairmen of the Honors Recommendations Committees for the various Divisions are:

Color. -Paul J. Wolf, APSA, 354 Fort Washington Ave., Hawthorne, N. Y. Motion Picture.—Nestor Barrett, APSA, 1220 University Ave., San Jose, Calif. Nature.—Louise K. Broman, APSA, 6058 S. Troy St., Chicago 29, Ill. Photo-Journalism.—H. A. Schumacher, APSA, Graffex Inc., Rochester 8, N. Y. Pictorial.—Robert L. McFerran, APSA, P.O. Box 893, Fort Wayne, Ind. Technical.—Konstantin Pestrecov, FPSA, 635 St. Paul St., Rochester 2, N. Y.

EXHIBITION LISTINGS

FRANK J. HELLER, APSA

Thirty exhibitions have published catalogues to date. They are: Lucknow, Memphis, Port Talbot, Calgary, South Shields, Hartford, Falmouth, Edmonton, Denmark, Springfield, Ill., Lea Valley, Vancouver, Edinburgh, Sacramento, Barcelona, Puyallup, Truro, Cleveland, Iris, PSA, Bath, Houston, Jonkoping, Arizona, Focus, Western Ontario, Witwaterstrand, Mississippi Valley, Southampton, and Scottish. The following exhibitors have had twenty or more acceptances:

HONORS APPLICATIONS DEADLINE

Because of the earlier date of the 1952 PSA Convention in New York City, the deadline for applications for Honors' consideration has been moved up to March 1st.

All applications must be submitted on new forms; don't use any old ones that may be available. Obtain the revised form from PSA Headquarters, 2005 Walnut St., Philadelphia 3, Penna.

Applications must be received in Philadelphia no later than March 1st for consideration this year.

THAT CHAMPIONSHIP MEDAL

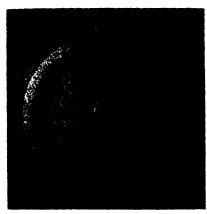

THOMAS T. FIRTH

A Championship Medal is not only an honor, but it is beautiful as well, and worth displaying nicely. Therefore, my first thought upon receiving mine was, "What shall I do with it?" I recalled seeing one that was carried in a loose-change pocket—subject to being scratched and dulled by contact with other objects, and I felt that m'ne deserved better care. After much time and thought I found one solution—a wall plaque—as shown in the accompanying photograph.

If you have access to a lathe, your task will be made much easier, but if not, you will have to whittle or carve the base. I used ¼ inch plywood, cut to 3¼ inches in diameter, sanded to a satin-smooth surface, and left in this natural finish. However, the disk may be varnished, lacquered or painted in color to suit the individual taste.

The mat-like ring, or frame, was turned from 1/8 inch masonite to an outside di-

PSA JOURNAL, Vol. 18, Jan. 1952

A Mounting for PSA Medal

ameter of 21/8 inches, and inside to 23/8 inches, with the inner edge beveled for added beauty.

The ring was then glued to the wooden disk, and the medal affixed in the center of the former by four brass nails, as inconspicuous as possible. When a small brass screw eye was placed in the top edge of the plaque, for hanging, the job was finished.

Possibly some may prefer purchasing a small, commercial picture frame in wood or gold, mounting the medal in the center of it, backed by velvet. This will give the same desired effect. Others, perhaps, will enjoy making their own frame, or plaque, and this method of mine may help, or at least serve as an inspiration to create some new method of display. In any event, let us get these medals out of obscurity and put them where they may be seen and admired.

GORDON C. ABBOTT 1882 - 1951

One of photography's most loved figures. Gordon Crowell Abbott, FPSA, ARPS, of Taxco, Mexico, died in Mexico City on September 6th after an illness of two months. For many years Mr. Abbott was PSA's Honorary Representative to Mexico.

Born in Goshen, Indiana, Mr. Abbott started with the Gross Printing Press Company of Chicago in 1902, became their secretary in 1921 and remained in that position until his retirement in 1933. He was a noted violinist and played with th. Edison Symphony Orchestra for many years. He was a co-founder of the Evanston Academy of Fine Arts and a member of the River Forest Library Board, the River Forest Tennis Club and the Union League Club of Chicago.

In 1907 Mr. Abbott joined the Chicago Camera Club, serving in practically every capacity, including the presidency from 1917-1918, exhibition chairmanship, program chairmanship, etc. He started their publication, "The Exposure," and was its editor for a decade. He was a prolific exhibitor and was honored by many photographic organizations for distinguished pictorial artistry and in recognition of

long and distinguished service and devotion to the Art of photography. He wrote many articles on photography and served as a juror on countless international exhibitions.

During the past two years, Mr. Abbott devoted all his time to experimenting with the Palladium Process, using hand sensitized papers. In May 1951 fifty of his prints were exhibited by the Smithsonian Institution in Washington and later at The Camera Club in New York City.

On the occasion of his election as an Associate of the Oval Table Society, high tribute was paid to Mr. Abbott's unselfish devotion to the best in photography. His many friends throughout the United States and Mexico mourn the passing of one of the truly great figures in amateur photegraphy.

EDWIN F. CASPER

Edwin F. Casper, a Charter Member of PSA and one of its most loyal supporters during the early days, died recently in Milwaukee after an illness of eight months. He was owner and president of Casper's Foto Shop, Milwaukee, a business which he founded in 1931.

He was an active photographer long before going into the business as a dealer and took a prominent part in the affairs of the Photo Pictorialists of Milwaukee and other local clubs. He was never too busy to help out with programs or other means of promoting amateur photography.

PSA NATURE DIVISION

HARRY R. REICH, APSA

286 Schenck St., No. Tonawanda, New York

Calendar of Nature Exhibitions

The Sixteenth Rochester International Salon of Photography, Memorial Art Gallery, Rochester, New York.

Closing DateFebruary 14, 1952
Exhibition Dates March 7 through March 30, 1952
Total Rejects returned by March 13, 1952
All Slides returned byMarch 27, 1952
All Prints returned by
Nature Jury - Dr. Gordon B. White, Port Colborne,
Ont., Can.
H. Lou Gibson, FPSA, Rochester,
N. Y.
Dr Robert L. Roudabush, Rochester.

For entry blanks or other information address communications to Dr. Robert F. Edgerton, 11 Fireside Drive, Rochester 18,

Third International Rose Color Slide Exhibition, sponsored by the Reading Rose Society and Berks Camera Club.

lege, Pa.

Wm. H. Rexman, ARS, Reading, Pa.

Fred Quellmalz, Jr., Hon.PSA, Kutztown, Pa. Gottlieb Hampfler, FPSA, Kennett Square, Pa. Harry L. Erdman, ARS, Hershey, Pa.

Entries may be submitted in any or all of three classes (with an entry fee of \$1.00 for one to four slides in each classification) as follows:

Class A .- One single bloom, showing stem and foliage. The winning slide will receive the Wm. H. Diller Silver Perpetual Bowl. Class B .-- Arrangements of blooms, any combination. The W. F. Drchs Perpetual Trophy will be presented for the best slide in this class.

FROZEN OXEN Art Ochl From The 1951 Chicago Nature Exhibition

Class C.—Rose Garden in Bloom, a new classification this year. The winner will receive the Nuchling's Perpetual Trophy.

In addition to the trophies there will be ribbons and certificates awarded to those slides picked by the judges as exceptional. Accepted slides will be duplicated and made available to camera clubs and rose societies throughout the country.

Brookfield Zoo Contest Judged

Here are the results of the Fifth Annual International Animal Photography Contest, sponsored jointly by the Brookfield Zoo and the Chicago Nature Camera Club, which was exhibited through the month of October at the Brookfield Zoo.

First:
FIRST PRIZE: J. M. Miller, LaGrange, Ill.
SECOND PRIZE: J. M. Miller, LaGrange, Ill.
THIRD PRIZE: F. L. Purrington, Wheaton, Ill.
HONORABLE MENTIONS: Joseph C. Amoedo,
Chicago, Ill.; L. S. Barrett, Seattle, Wash.;
Eugenia Buxton, Memphis, Tenn.; Anna M.
Carlson, Chicago, Ill.; Robert French, Chicago, Ill.; Ben Hallberg, Brookfield, Ill.; Henry
Krull, Chicago, Ill.; F. L. Purrington,
Wheaton, Ill.; L. E. Schmiedl, Chicago, Ill.;
Paul K. Weimer, Brookfield, Jll.

COLD STORAGE

Roy Schubert

From The 1951 Chicago Nature Exhibition

Slides:

FIRST PRIZE: Edward Gray, Buffalo, N. Y. SECOND PRIZE: C. W. L. Hunter, Washington,

THIRD PRIZE: Thomas R. Chapman, Elm-

hurst, Ill.

HONORABLE. MENTIONS: Esther Carlson, Chicago, Ill.; Thomas Chapman, Chicago, Ill.; D. R. Conklin, Chicago, Ill.; Angel de Moya, La Habana, Cuba; Willard H. Farr, Chicago, Ill.; Robert Glaze, Chicago, Ill.; Edward Gray, Buffalo, N. Y.; Lillian Gray, Chicago, Ill.; Blanche Kolarik, Chicago, Ill.; Robert J. Northshield, Chicago, Ill.; Frank E. Rice, Chicago, Ill.; Alice P. Stark, Toronto, Canada; Roy C. Stephen, Joliet, Ill.; Myrtle Walgreen, Chicago, Ill.; Joseph C. Wells, Chicago, Ill.; Mrs. Esther Wy, Washington, D. C.

Print and Slide Contests

We have been receiving numerous requests for entry forms for the Nature Division print and slide contests. We are very happy to receive these requests as it indicates an ever increasing interest. We note, however, that there are a goodly number of these requests from members of the Nature Division. We wish to advise that it is not necessary for members of the Division to make requests for entry blanks as they are mailed to all members of the Division as of record on the first of the month preceding the contests. Envelopes for mailing these blanks are addressed at Headquarters and forwarded to the Chairman for stuffing and mailing so that every one of our members should receive them unsolicited. For the benefit of readers of this column who are not members of the Nature Division and who wish to compete in these contests, please send your requests for blanks to the writer whose address appears at the head of this column.

Faces in Leaf Scars

If you are ever at a loss to find novel or interesting material for your nature photography in the winter time, by all means consider the subject of LEAF SCARS. Here, in the nearest park or woodland, you will find fantasy to your heart's content, in the shape of hundreds of droll faces peering out at you from the twigs of different species of trees and shrubs.

"What on earth," you may we'l ask, "are 'leaf scars'?". Here is the answer. When last year's leaf fell off in the autumn, it left a scar where it was attached to the twig. This scar represents the cross section of the leaf stem at its point of attachment. These scars assume a wide variety of shapes, each of which is a definite characteristic of the parent tree. They are hardly ever round, but may be ovals, crescents, triangles, heart-shapes, shield-shapes, or in a few cases a complete circle around the twig.

In the summer time, while the leaf is still alive and active, its stem is provided with tubes or channels for carrying sap and manufactured food. These "fibro-vascular bundles," as botanists call them, must be sealed off before the leaf falls in autumn so that no sap will be lost. Their dried ends then appear as dots within the leaf scar, and are known as "bundle scars."

Just as the shape of the scar itself is a definite characteristic of the tree or shrub, so is also the number and arrangement of these dots within the scar. They may be arranged singly or in rows, rings or crescents. The intriguing fact about all this

is that these bundle scars often form the eyes, nose and mouth of fantastic "faces," the outline of which is the leaf scar itself. To add to this fantasy, the winter bud which forms in the axil of the leaf before it falls off often provides a "hat" for the face below it.

Young, fast-growing saplings produce larger twigs and leaves than older trees, with correspondingly more luxurious specimens of leaf scars. As you might expect, the largest scars are to be found on the trees having the largest leaves, such as Ailanthus, Ash, Catalpa, Hercules Club, Horse Chestnut, Hickory, Kentucky Coffee Tree, Magnolia, Sumac, Walnut, etc. Altho the type of face is determined by the species of the tree, no two faces have exactly the same expression. You may find them happy or sad, ludicrous or grotesque, on the same tree.

A very good place to start your observations of these droll faces would be among the Walnuts. The scar itself is roughly heart-shaped, with three horseshoe-shaped bundle scars, which provide the eyes and mouth. Atop the scar is the winter bud, suggesting a jaunty hat. The White Walnut has larger and more interesting faces than Black Walnut. The various Hickories also have three bundle scars of somewhat different shape, but similar enough to indicate their membership in the Walnut family.

Ash faces are a lot of fun. A crescent-shaped row of bundle scars suggests huge negroid lips in a good natured grin. You can often find a twig in which one of the lateral buds forms a bulbous nose, two others a pair of bulging eyes, and the terminal bud a fantastic headdress of a jolly African chieftan.

The Elm has a wide oval face with beady eyes and a cocked hat reminding one of a reveller at a New Year's Eve party. Sumac faces have a nose that out-blossoms that of W. C. Fields. Horse Chestnut has a horseshoe-shaped scar, with the bundle scars suggesting the nails. Poplars and Alders also have some surprises in store when you study them.

The "cutest" face I ever found, quite by accident because it is so tiny, was on a twic of Prickly Ash or Toothache Tree. She has a round cherub-like face with laughing eyes, a rosebud mouth and a bright red fluffy hat formed by the furcovered winter bud. Kentucky Coffee Tree will furnish you with some studies in dog or fox faces, and some can see the face of a camel in Butternut scars.

The enormous doubly-compound leaves of Hercules Club require so much reenforcement at their base that the leaf scar practically surrounds the stem. Sycamore and Sumac have leaf scars that surround the winter bud. Trees with well developed stipules have pronounced stipule scars in addition to their leaf scars.

The winter aspects of trees are many and varied, and lend themselves admirably to photographic recording or even to pictorial treatment. Many a profitable field trip may be spent photographing tree silhoucttes, bark patterns, winter buds, galls, fruits, etc. etc. But I still insist that of all of these, none has quite the fascination of a camera study of "Faces in Leaf Scars."

W. H. FARR, APSA

PICTURE OF THE MONTH

A NEW ACTIVITY FOR EVERY PSA MEMBER

Every member of PSA is invited to send entriés each month to Picture of the Month, The Photographic Society of America, 2005 Walnut Street, Philadelphia 3, Pa. Prints are to be unmounted, not larger than 8x10, and each will list on the back your name and address, the title of the picture, the Class in which it is entered, your PSA Divisional affiliations, and a list of the portfolios of which you are a member. The last requirement is for those who will be taking part in a special contest between portfolio groups, which will be described later.

All entries are to be mailed in strong envelopes that can be used for the return of prints, discussions, Certificates of Award, or other matter. Return first class postage must be included, first class because much of the discussion of prints may be personal in nature. Entrants from foreign countries need not include return postage.

Prints in each Class will be judged by a special Board of Judges qualified in that particular Class, and five points will be awarded for a First Place print, three points for Second Place, and one point for Honorable Mentions. Every winning print will earn a Certificate of Award, which will carry the name of the maker and the title of the picture, and this will be sent back in the original envelope.

Earned points will be credited to the individual entrants and will be kept cumulatively from month to month, with the top scores being listed in PSA JOURNAL; at the end of the year there will be special prizes for the best scores. While the number of Certificates of Award that will be issued is not limited, one person can win in one month only one counted score, that of his highest scoring print. This is to prevent a small group of the best photographers from winning all the points, and to give everybody a chance.

Prints winning Certificates of Award will be retained, with the permission of the entrants, and will be mounted in books along with the names of the makers find other pertinent information; exhibited at the PSA Convention, and then turned over to the PSA Library for the general uses of the Society and for circulation to interested groups. In this way the prize winners will be doing something worth while for other PSA members less skillful than themselves and will be contributing to the general assets of PSA. This feature is voluntary, if you ask for the return of your prints they will be sent back to you.

Prints not winning Certificates of Award will be returned to the entrants in the original envelopes and, with the exception of the Open Class prints, discussions by experienced photographers will be included, as much and as personal as we are able to give with the facilities at our disposal.

If prints are received from members who are to serve on the presiding Board of Judges, these will be held over to the following month when different judges are making the selections. This activity is for everybody, including judges.

For the month of January 1952, the following Classes are available:

Class 1. Open Pictorial.

No restrictions of any kind, except size, and open to any member of PSA. Prints in this Class will not be discussed when they are returned.

Class 2. Advanced Pictorial.

For any member of PSA who makes his own prints and has not hung more than two different pictures in two international, national or state salons. When prints not winning Certificates of Award are returned, they will be discussed by qualified analysts.

Class 3. Beginners Pictorial.

For any member of PSA who made the original exposure, but had negatives developed or prints made by others, amateur or professional. When prints not winning Certificates of Award are returned, they will be discussed by qualified analysts.

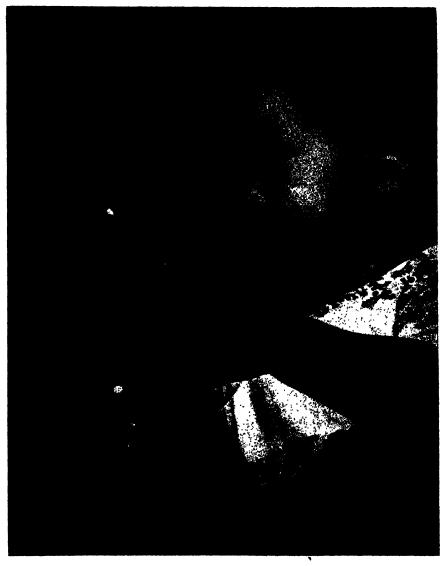

Class 4. Open Portrait.

No restrictions of any kind except size, and open to any member of PSA. Prints in this Class will not be discussed when they are returned.

Class 5. Beginners Portrait.

For any member of PSA who made the original exposure, but had negatives developed or prints made by others, either amateur or professional. When prints not winning Certificates of Award are returned, they will be discussed by qualified analysts.

These five Classes are under the direction of the Pictorial Division, but all members of PSA, whether Pictorial Division mem-

HARD WORK

Masaru Taketa

bers or not, are invited to compete, and are eligible for the outlined services. If special prizes are offered later on for top scores, Pictorial Division hembership may be made a requirement to win.

Class 6. Advanced Nature.

For any member of PSA who makes his own prints, but has not had prints accepted in any nature salon. When prints not winning Certificates of Award are returned, they will be discussed by qualified analysts.

Class 7. Beginners Nature.

For any member of PSA who made the original exposure, but had negatives developed or prints made by others, either amateur or professional. When prints not winning Certificates of Award are returned they will be discussed by qualified analysts.

Classes 6 and 7 are under the direction of the Nature Division, but all members of PSA, whether Nature Division members or not, are invited to compete and are eligible for the outlined services. If special prizes are offered later on for top scores, Nature Division membership may be made a requirement to win.

The Nature Division also provides direct two Nature Print Contests, one in January and one in May; and two Color Slide Contests, one in April and one in September. Entry forms for these Open Contests will be mailed to the entire membership of the Nature Division at the proper times.

Class 8. Abstractions, Photograms, Unusual Effects.

An Open Class for every member of PSA, no restrictions of any kind except size. Returned prints will not be discussed, but it is hoped the makers will include discussions when they send the pictures to us. These can be included when mounting the Certificate-winning prints in books for the PSA Library.

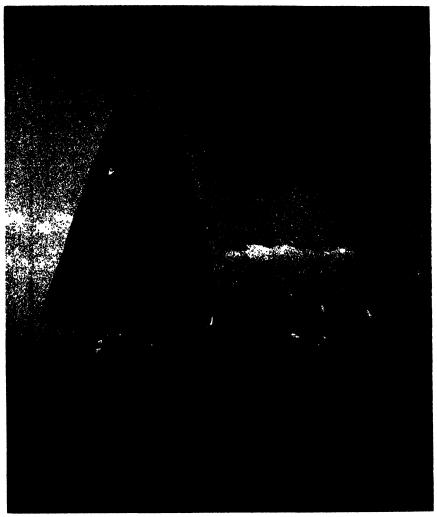

Special Contest for the Pictorial and Portrait Portfolios.

The score earned by each print in the general Classes will be credited to the individual, and where membership in Pictorial or Portrait Portfolios is shown on the back, the points will also be credited to each Pictorial or Portrait Portfolio of which the entrant, regular member or Commentator, belongs. The total scores of each portfolio will be kept cumulatively, the highest will be listed in PSA JOURNAL from month to month, and at the end of the year the members of the top scoring portfolio will receive special prizes.

General Information.

The Picture of the Month activity, as listed above, is in the preliminary stage; rules can be changed from time to time and additions to the general Classes or Special Contests can be made when there is a great enough demand for them. Ideas and suggestions will always be welcome from anybody; this is your activity and you can make it anything you like. Address all correspondence to Picture of the Month, The Photographic Society of America, 2005. Walnut Street, Philadelphia 3, Pa.

JOHN R. HOGAN, HON. PSA, FPSA, "Chairman.

This and "Hard Work" on pg. 33 were previous winners in Print of Month Contest.

ON THE JUDGING OF PORTRAITS

MAURICE H. LOUIS, APSA

The judging of portraits presents different problems than those faced by other types of photographs.

The end-use of the portrait, in other words, the aims and intentions of the maker, are of far greater importance than when judging, let us say, a landscape. In one group of portraits under consideration there will be some made to please the subject, some the judges, while others the photographer himself. Yet the judges are unaware which are which and must apply the same values to all.

No two people will agree what makes a good portrait. Nor will two photographers "see" the subject in the same light. Yet all will agree that the finished print must clicit some emotion within the breast of the viewer.

Some portraits will forcefully convey a message, others will subtly create a mood. If the photographer has achieved his purpose, who are the judges to say one is a better approach than the other.

Most portraits strive to reveal the true personality of the subject. At best, it is no easy task! But we do know that success is only obtained if the photographer has been able to capture an expression which is both realistic and alive. There is no room for sham or unnaturalness. This is especially true in pictorial or character portraiture where more imaginative interpretation is permissible.

The techniques or props used are of value but of secondary importance. Likewise are whether the portrait is candid or posed; close-up or long-shot; or expressive of a likeness (a personal photograph) or type (symbolic of a type or idea).

In the final analysis does the portrait make you stop to give it a second glance, does it draw from you an emotion, does it make you think or want to act? If it does any of these, the maker has been successful. How he has accomplished this is relatively unimportant.

Consequently there being no standard techniques for the making of portraits, there can be none for judging them.

PSA JOURNAL, Vol. 18, Jan. 1952

Devoted to News of the Pictorial Division of the Photographic Society of America

OCTOBER INTERNATIONAL CLUB PRINT COMPETITION

L. to R. Alonzo Lansford, judge, Louis P. Ganucheau, Jr., president of Delta CC, Ray Mathewson, judge, and Fonville Winans, judge. The winning pictures, "The Philosopher", by Sam Cohen of the Oakland CC, first place; "Potters Hands", by Willard C. Hungerford of the "Tiro de Los Padres" Club, second place; and "In the Grove There is Melody" by Edward Bafford of the Baltimore CC, third place. Photo by Mrs. Mona Heinecke, member of Delta CC.

Effective with the first competition of the new season, held on October 27, the International Club Print Competition is now being handled by the Pictorial Division. Robert J. Lauer of Milwaukee, Wisconsin is the new Director of this activity.

The October competition was judged in New Orleans under the sponsorship of the Delta Camera Club, with 236 photographs entered from clubs throughout the United States, Canada, and even from far off India. Louis P. Ganucheau, Jr., president of the Delta CC, commented especially on the fact that print quality was exceptionally good and the subject matter was very diversified.

Judging took place at the Louisiana State Muscum's Presbytere Building, located next to St. Louis Cathedral in the heart of the Vieux Carre' (Old City). Quite a few of the club members attended the judging in order to improve their own pictures through the comments of the judges. Among the members of the Delta CC attending was Pops Whitesell, FPSA.

The three judges were well qualified to handle a competition of international scope as they represented various fields:

Mr. Alonzo Lansford, Director of the Isaac Delgado Museum of Art in New Orleans and a well-known judge, represented the artist's viewpoint as applied to photography.

Mr. Ray Mathewson, a locally prominent judge, added balance based on his wide experience in all types of photography with special emphasis on landscapes.

Rounding out the judges was Mr. Fonville Winans, a well-known portraitist, a Master Photographer of the PA of A and a member of the Camera Craftsmen of America.

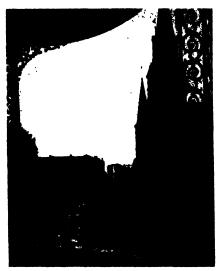

The highest scoring print received 23 points (out of a possible 30). It was "The Philosopher" made by Sam Cohen of the Oakland CC. Sam will receive a silver medal bearing the PSA emblem. The makers of the next two highest ranking prints, "Potters Hands" by Willard C. Hungerford of the "Tiro de Los Padres" Club, and "In the Grove There is Melody" by Edward Bafford of the Baltimore CC will also receive medals.

Trophies will go to the top ranking clubs in each class, Oakland CC in Class A with 70 points and the Mission Pictorialists of San Francisco in Class B with 57 points.

It is interesting to note that size of a print does not always determine its appeal. One of the highest scoring entries was "Muggin" by Don Thomas of the Grosse Pointe CC. Don's print was only one point short of a three-way tie for third place, and captured an honorable mention. Its size was 8x10. As one of the judges put it, "art is not sold by the pound."

Next month a complete listing, showing the scores of all participating clubs, will be published. The December judging was held at Oklahoma City and was sponsored by the Oklahoma CC.

For full particulars as to how your club can enter the International Club Print Competition, write Robert L. Lauer, 807 South 14th Street, Milwaukee 4, Wisconsin.

"In the Heart of the Vicux Carre'" by Louis P. Ganucheau, Jr. Judging of the October International Club Print Competition was held in New Orleans, Louisiana. Meeting place of the Delta CC is in the Presbytere, a State Museum next to famous St. Louis Cathedral. St. Louis Cathedral is the heart of the Vieux Carre' (Old City), and is pictured here through the lacy iron grillwork of the Pontalbo building.

GEORGE GREEN, Associate Editor

I don't remember who said it and I'm too tired to check but someone once uttered a mouthful with this excerpt: "As ye sow—ye shall reap." And that can be applied to anything and everything Joe Human does.

If you were observant you would have noticed the statement "I'm too tired to check." And therein lies the crux of a great many things we do; especially in photography. This wonderful, exacting, stimulating, modern magic has many facets

which are supposed to relax the tenseness of a day's work. What we create in the darkroom should be so encompassing and exacting that we have no thoughts for anything but perfection. But, unfortunately, most of us are too tired to attempt to achieve that goal.

Why does a person's work change? Because the majority are average human beings. Their hobby is only a pasttime while it can offer amusement and entertainment. When it passes those phases it immediately becomes a chore; and most chores are bothersome and performed quickly. The very nature of such performance is such to prevent perfection. And that's why so many entries in salons and club competitions are so shockingly amateurish.

Of course, I could look at myself and pointingly ask where I get off with this sort of an article. After all there has been many a column I've dashed off to meet a deadline . . . and then wondered how I could have turned out such work. Haste, in photography, very rarely makes the ribbon class. It takes and demands an inner feeling of complete relaxation and concentration to do anything creative.

By the same token it requires a competent analyst to look over the finished product and offer constructive criticism. The human equation of routine becomes commonplace because a deepening rut is so easily applied to anything which remains unpraised. Only by satisfying the ego is one conscious of the groove he is making—either upward or downward.

Just like I'm pulled-up every so often by my critics, you require the same treatment if your darkroom endeavors haven't brought you results and acclaim. To think that this is all yours free because you are a member of the Pictorial Division! You can have your prints analyzed by the director of the Personalized Print Analysis, J. Elwood Armstrong. All you have to do

PSA International Portfolios

There are openings in the following PSA International Portfolios for Pictorial Division members who are interested in interchanging prints for comment and analysis with the leading photographers in foreign countries:

Anglo-American Canadian-American India-American Australasian-American Cuban-American French-American Swedish-American South African-American Brazilian-American Belgian-American Chinese-American Netherlands-American Dominican-American International Medical Portfolios Costa Rican-American Carribbean-American Mexican-American International Control Process Portfolios

For information, write to the Director of PSA International Portfolios, Col. Charles J. Perry, 7431 Ryan Road, El Paso, Texas.

is make a 5x7 or 8x10 plus a contact print (the first two sizes may be cropped in any manner you desire but the contact must be of the entire negative). Include a brief statement of the idea or purpose behind the picture and whether it was taken for the purpose of competition, etc. Give all pertinent technical data.

Send the prints by first class mail, including return postage and mailing label. Be sure to print your name and address on the back of each print plus the picture's title. Send them to J. Elwood Armstrong, 17402 Monica, Detroit 21, Michigan.

The Award of Merit

Changes in standings since the last list was published are as follows:

New One Star Exhibitors
Simon Goldsmith, Jackson Heights, N. Y.
Arthur F. Smethurst, South Orange, N. J.
Philip Solomon, West Hartford, Conn.
B. K. Mukerjee, Calcutta, India

Advanced from Two Star to Three Star Charles L. Wilson, San Diego, Cal. O. E. Romig, Pittsburgh, Pa.

Advanced from Three to Four Star G. Thomas, Bangalore, India

If you feel that you are eligible for the Award of Merit, submit proof of your exhibition record to Glenn E. Dahlby, Director. Awards are retroactive and all Pictorial Division members are eligible, without charge.

A. LYNNE PASCHALL, Associate Editor

If I read my calendar correctly, the month is now January and it is high time we were out taking snow pictures, to say nothing of getting next year's Christmas cards ready. Or are you one of those indoor sportsmen who is afraid of getting his feet wet and doesn't like winter anyway?

I know a promising beginner who submitted his first effort at snow photography to an expert for criticism and advice. The answer he received was as cold as the picture itself. The would-be expert pointed out a few minor defects and then said, "... but after all, it is only another snow scene and they are too old and too commonplace to get into a salon these days."

Of course, snow is old, everything in this world is old, but there are still new revelations and new beauties for anyone who cares to look for them. If a really fine snow picture fails to make a salon, then judges have fallen to a much lower level than I think they have. And as to being new, there is nothing new about the kind

of cheesecake that is so much in vogue now. We used to get that kind of art in exchange for cigarette coupons, back in the days when cigarettes were not considered quite respectable either.

And that reminds me: As I write these lines (in late October) the Detroit Convention is still fresh in my mind and I can't keep from talking about it. One day while I was waiting in the lobby of the Book-Cadillac, I fell into conversation with Franklin I. Jordan (well known to the reading public as "Pop") and Roy Mc-Adams, a prospective member of PSA. Roy was expressing his distaste for a certain type of photographic magazines that are interested only in the dollar and care nothing about real art and decency. "If you are interested in a magazine that devotes all its energies to advancing photography and doesn't even try to make a profit," I ventured, "let me recommend PSA JOURNAL." And Pop SEZ: "Now, you've said something!"

The activities to which we have been calling attention in this column have been in great demand for program material in recent months, and the directors have been busy filling orders, so all the services will be continued.

The first man I met in Detroit was Sten Anderson. We had never seen each other before and met quite by accident. Sten was full of enthusiasm for the Portfolian Club movement and he had written a very fine article for this column. It explains very clearly what is to be gained by forming a Portfolian club, and we are planning to publish it just as it is, next month, but if you contemplate organizing a club do not wait but write to him at once.

I looked everywhere for Fred Fix and had about given him up when, on the last day, he laid his hand on my shoulder and called me by name. It's nice to have people in PSA remember you. Fred said that American Exhibits have been very popular and most of the shows are booked up for months ahead. And that's a better recommendation than anything I could write.

He did have some good news for program committees, however. The Standard Oil Company has furnished some remarkably fine documentary photographs that tell the story of America today. There are many pictures of human interest as well as a few of technical installations, and all are done in a pictorial manner difficult to improve upon. The photographs are the work of several men and have been assembled and edited by Roy Stryker.

The exhibit is divided into three sections which may be had separately or as a unit. Any section would serve as material for an evening's program for a camera club, or make an interesting display for the club room. These pictures are available for immediate booking and only the transportation costs need be paid by the club, there is no service charge.

Philip Maples appeared at the meeting of the Fictorial Division and let the Recorded Lectures speak for themselves. He had a tape recorder on the platform

and played the introductory paragraph of each lecture for us. Phil is arranging some new distribution centers across the country in order to expedite delivery of recorded programs.

William Hutchinson, who arranges the Print Circuits for Camera Clubs, did not get to Detroit but he wrote a letter saying he was launching a new circuit in which the following clubs are cooperating:

Carney's Point CC, Penn's Grove, N. J.
Catawba Valley CC, Hickory, N. C.
Topeka CC, Topeka, Kans.
Bartlesville CC, Bartlesville, Okla.
Griffin CC, Griffin, Ga,
Central Florida CC, St. Petersburg, Fla.
Columbus YMCA CC, Columbus, Ohio
Ft. Steuben CC, Steubenville, Ohio.
Commentator: Dr. William F. Small, APSA.

If your camera club has never taken part in one of these circuits, you had better get it started right away. The club needs only three prints but have them ready when you make application so that they can be shipped in as soon as Bill calls for them. Remember the other seven clubs are champing at the bit and ready to go.

I looked for Dennis Anderson, to ask him how the Portfolio of Portfolios is coming along, and his name was announced at the Pictorial Division Meeting, but he was delayed somewhere along the way and I never did get to meet him. Neither did I find Henry McKay who finds out-of-town judges for our picture contests. Have you tried that service yet?

Col. Charles J. ("Joe") Perry,
Associate Editor

From the four corners of the earth, to the four corners of the earth, we extend to each of you our heartfelt greetings for a most prosperous and Happy New Year.

The 'Internationals' bear proof that pictorial photography is unhampered by global distances. Pictorialism adheres to no specific creed or sect and embraces in its felds all races of the earth and all stations of life. Our portfolios constitute the common ground upon which serious pictorialists of the world gather for friendly exchange of comment and technical 'know-how' information.

At the commencement of this New Year we extend to all a warm greeting of fellowship, with a sincere wish that 1952 will be the year in which your photographic hopes will ripen into fruition and your every desire will reach fulfillment.

As we look toward the year ahead with anticipation, the encouragement received during the Detroit Convention is yet ringing in our ears. The personal contact and greetings from our friends of Mexico, Cuba, and Canada were indeed encouraging, and we pass along to our American membership the felicitations so warmly and enthusiastically extended to us.

There are still vacancies in the International Portfolios for qualified Americans. If you want a new viewpoint, an honest comment, a warm grip of fellowship—it is here for the taking.

MISS EVELYN ROBBINS, Associate Editor

Chirps From the Robbins

I wish each of you could have been at the Convention in Detroit! The gang there did a mighty fine job.

Just imagine a Portfolio Room with plenty of tables to spread out the portfolios to look at them comfortably and plenty of chairs. You could sit and browse through the portfolios or chat with friends! If you walked into the room at any time, you were sure to meet portfolio friends you had met previously, as well as others by their name tags. You were certainly made toyally welcome; and especially by our Director of the American Portfolios, Eldridge Christhilf, Hon. PSA.

I'm sure there must be many many more cases like this one, but I was personally fortunate enough to meet, there in the Portfolio Room, a PSA member who did not belong to a portfolio. In the course of the conversation he divulged the fact that he had little or no contact with a camera club of any kind. What was the answer to his problem? Portfolios! Naturally!

We took him around to inspect all the portfolios, explained them to him in full detail, and introduced him to our Director. Before he left the room, we had him signed up for two portfolios. Today, I received a note from him—he has just joined the third! He is quite excited about them, and justly so. He is located in an area where he needs them badly, and will get a lot out of them—both in photographic knowhow, as well as friendship with people who have a mutual love for a hobby.

If there is anything in that old saying, "Practice what you preach," then I am now qualified to "preach" the praises of the Portfolio Activity and urge each and everyone of you to join—first, the Pictorial Division; then, the portfolios. It seems I returned home from the Convention with memberships in five portfolios. . . it was only three before Detroit!

Random Thoughts

ELDRIDGE R. CHRISTHILF, Hon.PSA, APSA Detroit is behind us, and New York lies ahead. From the viewpoint of the Port-

folio Room, the Detroit Convention was a decided success. We had, as promised, a very large room—the Park-American Room -where there was ample space to meet and browse thru the various portfolios that had been brought on for the Convention. The room was a busy place at all hours, even when important programs were under way elsewhere in the hotel.

This year we carried out our avowed intention of foregoing all programs and sticking close to the Portfolio Room. The only time we were away from the Room from 9 AM until 11 PM was to take time out for lunch at noon and dinner in the evening. In spite of the fact that we were there at all other hours there were quite a few who registered in the Portfolio Room with whom we never did succeed in catch-

For group attendance the honors go to Pictorial Portfolio #19 and to Nature Portfolio #1, each of whom had 8 members in attendance. From Pictorial #19 there were:

John R. Hogan, Hon.PSA, FPSA, Philadelphia,

Pa.
Franklin L. Purrington, Wheaton, Illinois
J. Stanley Nixon, Kenmore, New York
Cal. Charles I. Perry, El Paso, Texas Col. Charles J. Perry, El Paso, Texas Evelyn M. Robbins, Springfield, Illinois Fred L. Pyle, Wabash, Indiana and Biloxi, Mississippi

Edith M. Royky, Sioux City, Iowa Doris Martha Weber, APSA, Cleveland, Ohio

The group representing Nature Portfolio #1 consisted of:

William Cottingham, Winfield, Kansas Ray Miess, APSA, Milwaukee, Wisconsin E Curtis Lugg, Sioux Falls, South Dakota Cy Coleman, Detroit, Michigan Helen Albertson, Sioux City, Iowa Belle McMillen, Lansing, Michigan Arthur E. Anderson, Chesterton, Indiana Lou Gibson, FPSA, Rochester, New York

The Commentators Conference was well attended and many interesting ideas and facts were presented. Details of that will be given later either in the Digest or thru the Portfolio Notebooks. One of the outstanding things of the Conference was the bonus that is to be made available to those Portfolio Circles which complete their circuits ahead of schedule. The details of this bonus will be given elsewhere in the JOURNAL, either in this issue or in an early one. So, be prepared, do everything possible to speed up your portfolio so that you can benefit.

The names of many who are active in the portfolios either as Commentators or portfolio members are on the Honors list this year. Fellowships went to:

F. R. Altwater-Commentator, Pictorial Port-

folios

J. Elwood Armstrong—Commentator, Pictorial

Star Exhibitor Portfolios Portfolio and member, Star Exhibitor Portfolios
Axel Bahnsen—member, Star Exhibitor Portfolios Isadore Berger -- Commentator, PSA Journalism Portfolio

Frank E. Fenner-Commentator, Pictorial Port-

H. Lou Gibson---Commentator, Nature Portfolio Barbara Green-Commentator, PSA Pictorial Port folio

John G. Mulder-Commentator, Pictorial Port-folio and member, Pictorial Portfolio II. W. Wagner-member, Star Exhibitor Portfolio.

Associateships went to the following:

Henry W. Barker-member, Pictorial Portfolio

Dr. C. F. Cochran - member, Pictorial Portfolio Gretchen H. Goughnour-Commentator, Pictorial Portfolio

Larry D. Hanson- Circle Secretary, Pictorial Portfolio

George Horn--Commentator, Pictorial Portfolio Herbert Jackson--member, Pictorial Portfolios Lee Jenkins--member, Pictorial and Nature Portfolios

Cortland F. Luce - Commentator, Pictorial Portfolio and member, Star Exhibitor Portfolio Herbert P. Paschel member, Pictorial Portfolio

Walter J. Pietschmann - member, Pictorial Port-

Paul J. Wolfe -Commentator, Pictorial Portfolio and member, Star Exhibitor Portfolio.

To each of these go our congratulations.

JUNGLE RIVER

W. G. Clayton

Portfolio Medal Award

We are pleased to announce another Portfolio Medal Award winner this time William G. Clayton of Grand Island, Nebraska. His print, "Jungle River," reproduced in the Digest this month, had travelled in Pictorial Portfolio #29. It was later accepted and hung in an international salon.

The winning picture was taken with an Auto Rollei with an f/3.5 Tessar lens in February 1950 about six miles in the jungle from the Parinam River in Surinam, S. A. Bill, in writing about the picture, says:

"We were riding back from the Bauxite mine and had just crossed a bridge and I noticed a bush Negro paddling his canoe upstream. I asked the driver to stop, and I dashed out to get a movie of the native. In so doing I noticed this scene down at the end of the bridge and paused long enough for a picture or two."

The part that Bill did not tell is that he and Mrs. Clayton, suffering from a severe attack of "wanderlust" boarded a Norwegian freighter and became vagabonds for five full weeks. They flew from the frigid winter of Nebraska to New Orleans and embarked on their journey which took then to Kingston, Jamaica; Port-au-Prince, Haiti; Dominican Republic; St. Thomas; Dutch Guiana, where the picture was taken; Trinidad and points south. Bill kept his cameras busy on this trip for he came back with 2,000 feet of 16mm movie film, took 150 color slides and over 350 black and white exposures.

Comments by a Commentator

Dr. CARROL C. TURNER, APSA, Commentator, Portfolio #60

What are my comments as a Commentator? As a member of one of the early Pictorial Portfolios, and at present Commentator for #60, several observations come to mind. First, as to the overall purpose of the portfolio.

Naturally when a group of people are working together toward one objectivenamely, to make better pictures—a feeling of camaraderic develops and as the different circuits arrive and are passed on (sometimes late) to the next member of the circuit, interests other than photographic spring into existence. How old is Bill, and where did he spend his recent vacation? John and Mildred have a new arrival in the family, and sometimes a snap shot of said new arrival (diapers up) is appended to a long dissertation on said new arrival and pasted into the book of comments. Don has left us, as his new job required a transfer to parts outside the geographical limits of the circuit. Charles and Mary made some new Christmas cards-a sample of said card also pasted into the book of comments, and how do we like 'em. Ella's three year old had a cold the last time the circuit arrived and she did not have time to make a print for the collection section. These and sundry other personal interests appear; and, as aforesaid, are aimed at developing and nurturing a feeling of mutual sociability among the circuit members. This is all fine and is commendable in cultivating a feeling of intimacy in the

But what of the true aims of the portfolio? Would it not be more helpful to the group composing the portfolio to limit comments in the notebook to individual photographic problems, with which each of us is confronted-from the time we make an exposure to the completion of the print in the darkroom? Each one of us is in a position to offer helpful suggestions from our own experiences with the same prob lems and our final solutions or partial solutions of these problems.

My next comment would refer to the dilatory tactics of some of the members of the circuit (and I am just as guilty as any) in acknowledging receipt of the circuit and in keeping it bottled up longer than the prescribed five days allotted to each member. For the convenience of the others in the circuit, it is urgent to expedite its manipulations while in one's hands as promptly and diligently as possible. Realizing that on occasion there are unavoidable delays in holding up the circuit, it behooves each of us to take an evening out as soon as the circuit is received, have a print ready for the collecting section, take care of the comment section, take your folder and print out of the removal section, and get the circuit on the move to the next member. This criticism may seem superfluous, but we are all guilty at times of stalling the circuit with unnecessary and avoidable delavs.

My last comments are in reference to the overall quality of the prints. Since most members of portfolios have, or hope to

develop, salon ambitions, more time could be allotted to composition. Some people seem to possess an aptitude for a good composition by nature. Their pictures are well balanced, simple in arrangement, have a well placed center of interest and depict a mood or story. To most of us, however, composition comes the hard way, and is acquired only by long experience, observing the work of others well trained in composition, and by reading publications and articles on the subject. Anyone versed with the use of a camera can shoot a scene or a situation, but not everyone can produce a picture.

As to print quality, a good percentage of the prints are remarkably clean and well executed technically. There are some still coming through that are flat, lack snap and have an overall grayness, or muddiness. To these I would suggest:

- 1. Shorter projection exposure.
- 2. Longer print development- even up to five minutes, provided that
- 3. The developer is fresh and is not too cold. Cold developer yields flat prints- and
- 4. A red safety light about an E. K. #2 over the developing tray. If you don't believe an amber safety light will fog prints during long development, try this experiment. Place a coin on a piece of sensitized paper and leave it under your amber safe light about six to eight minutes. Then develop this piece of paper and see what you have.
- 5. Fit your paper to your negative. Except with those experienced sufficiently with print manipulation, a #2 paper will not yield a satisfactory print from a thin negative.

And now, having drained off some of the mental pus as "Comments by a Commentator," I seen my duty and I done it. S'long 'till another time.

"Star Dust" *

ROY E. LINDAHL, General Secretary, Star Exhibitor Portfolios

The problem of sharpness is a real one and nearly as controversial as the previous discussion on Photography vs Art. That it is closely integrated is hardly questionable as there is requirement for as many degrees of sharpness in our pictures as there are moods and type of subject matter. Likewise, many factors affect our results and more of these are brought out in the following letter by another member.

"Getting back to John's listing, he completely overlooked a tremendous factorthe advantage of interchangeable lenses in the larger cameras. Naturally, the longer the lens the more critical the focus. This calls for experience. I thoroughly agree with him that the twin-lens jobs have great depth, but they have many horrible disadvantages and I do not bother with them. The main objection, as I see it, is the distortion. Several years ago someone hit the top with several beach scenes, actually, buildings in the distance were bent! I

AN INVITATION

This is an invitation to every PSA member to participate in the PSA American Portfolios.

Enrollments are now being received in the following specialized groups:

PSA Pictorial Portfolios PSA Portrait Portfolios

PSA Miniature Portfolios

PSA Control Process Portfolios PSA Star Exhibitor Portfolios

(For PSA Award of Merit Winners) PSA Nature Portfolios

PSA Photo-Journalism Portfolios

For information concerning any of the foregoing activities and for enrollment blanks, write to the Director of the PSA American Portfolios, Eldridge R. Christhilf, Hon. PSA, APSA, Suite 406, 800 Davis Street, Evanston, Illinois.

am accustomed to vertical or horizontal lines unless I am seeking something unusual

"When I use a 5x7 I have a choice of a +1/2"--6"--81/4" or 12" Goerz lens. To me, this is ideal - when I find the ideal angle I choose the proper lens instead of moving up to fill the ground glass. Furthermore, I finish with several negatives not a drawer full mixed with indecision. Axel will vouch-I made two negatives, one vertical and the other horizontal. From these two shapes I will sell prints for years to come. Another great advantage--I can do any amount of correctional work without any worry. Frequently, I intensify and reduce a negative locally and pencil. dye or etch.

"Back to cameras again, John, how many times have you looked at a negative and wished for a fraction of film on one side or the other? I do not have that problem, as it is always there if I feel the need for it-this alone would convince me that the large camera is desirable. To wind up the discussion of cameras I suggest that, regardless of what camera one uses, stick to only one-and you will get far better results."

Another member questions the desirability of extreme sharpness in all pictures as he writes: "Do we get variety in the way of discussions in this notebook? One time it is about photography as an art and now it is how to help John get sharp pictures via the large camera route. I agree with a lot that has gone before, except PH's statement that negative size has practically nothing to do with the question. Theoretically, that may be true, but I have noticed that it does not work out that way. It seems that, no matter how sharp the negative can be made, there is some loss of definition in the enlarging process somewhat in proportion to the enlarging ratio, but for some reason or other, I do not seem to be as definition-conscious as a lot of people I know. I came into photography while there was still a lot of good soft-focus work being done -did a little of it myself and still like it when it is well done and appropriate to the subject matter.

"I do think that your straightforward analysis of the correlationship between film size and sharpn'ss based on the prints in this portfolio overlooks am important item. First off, these prints were not chosen for inclusion in this portfolio because they were the sharpest that could be produced by a film of the size that was used. Too many other variables enter into the sharpness of these prints, variables about which you have no knowledge, yet variables which should definitely be taken into account. Perhaps one of the most important of these variables has to do with whether the camera was hand held or on a tripod."

The following communication was recently received from PSAer W. J. Schubert, a past president of The Camera Club of New York City. It contains so many valuable points, we are reproducing it here

"I noticed Mr. Hogan's letter on page (2)71 of the November JOURNAL regarding lens resolution, and as this is a subject I've done some work on, and as I enjoy talking shop, here goes:

"Our company (the Fairchild Camera & Instrument Corporation) at one time considered building amateur cameras, and one of the first specifications I set up was that they should be capable of producing razor sharp negatives. My thought was that where diffusion was wanted, the user could introduce it to his heart's content by any of several methods, but that maximum sharpness in our cameras would be a 'must'.

"Our work developed the fact that razor sharp prints depend on an astonishingly large number of things besides the camera; in other words, print sharpness is not a matter of fulfilling one condition superlatively well; it is rather a case of hitting a high average in fulfilling a considerable number of conditions. In fact, so many conditions are involved that they will have to be captioned and numbered to keep track of them all. According to my experience. these conditions effect sharpness:

- 1. The lens-shutter combination obviously must deliver high average sharpness at the focal plane over the whole film area.
- 2. The camera must be sufficiently accurate and rigid to hold the film within the lens' depth of focus. (This depth of focus is much narrower than is generally realized.)
- 3. Subject matter must be such as will utilize the sharpness.
- 4. Focussing, of course, must be really accurate. Focussing by parallax does the best job. Also, when focussing visually on the groundglass, the photographer will nearly always focus a trifle too
- 5. Focus-shift: If the focussing is done on a groundglass, the lens must be stopped down before final focus, unless a symmetrical lens is being used. Most unsymmetrical lenses, such as the Tessar construction for example, will shift focus slightly as they are stopped down.
- 6. Aperture Setting: Every lens has its point of greatest resolution, and this is usually about two stops down from the full aperture. An f/4.5 lens, for

^{*} A monthly column devoted to the "Wit and Wisdom" of the Stars as taken from the Note-books in the Star Exhibitor Portfolios.

example, will usually deliver its sharpest resolution at about f/8. Also, when we get much beyond 1/16 diffraction begins to bring in some over-all soften-

- 7. Camera Shake during exposure must be held so far down that it will not result in blurring of more than 1/200th inch in the finished print. (In my experience, camera shake is more serious than is ordinarily realized; I have been surprised a couple of times when what I had thought was a "soft" lens delivered excellent resolution when the exposure of the resolution chart was made with an electronic flash of 1/10,000th second, or faster.)
- 8. Film: Personally, I have never been able to get really sharp enlargements from negatives made on fast emulsions; I get my best results on the medium speed or fine grain films. Maybe this is just personal opinion, because there is not too much difference in the resolution claimed by makers between the different emulsions.
- 9. Exposure must be sufficient, but both over- and under-exposure must be
- 10. Processing: Development must be sufficient, but not excessive. I personally have gotten sharpest results by holding both the exposure and the development to the minimum that would produce a negative that would make a good print on #2 contrast paper. Also, I have gotten best results when developer. rinse, fix and wash water can all be held within a temperature range not exceeding 2° F, plus or minus. Even and fairly rapid drying also tends toward better negatives.

"If you have maintained that aforesaid high average of performance so far, let us now make the print:

- 11. Enlarger Lens: Contrary to general impression, our enlarger lens must also be sharp, for our print is going to contain the sum total of the residual abberrations from both the taking and the enlarger lenses; abberrations in one won't offset those in the other.
- 12. Easel: We must level up our casel so that it holds all areas of our paper in the lens' focal plane.
- 13. Don't forget to check focus again after the lens has been stopped down for the exposure.
- 14. Also, wherever possible, use one of the mid-apertures so as to at least be near the lens point of sharpest resolution.
- 15. Enlarger vibration will hurt as much as camera shake. It is surprising how much vibration occurs in buildings when a heavy truck or streetcar passes, even at some little distance.
- 16. Paper processing must also, of course, be done according to Hoyle.

"Yes, I thoroughly enjoy talking shop. These comments aren't intended to be discouraging--rather they present a challenge to see how sharp a print we can turn out. And a final thought-if you have ever produced one sharp print with your present equipment, then the equipment is all right!"

W. J. SCHUBERT

VIEWS AND REVIEWS

BY THE EDITOR

Imitate to Create

I was surprised and challenged in reading an article in a recent copy of the Ansconian to find the writer actually recommending that photographers imitate the work of others. But the longer I thought about his comments, the more sense they seemed to make.

Here are some of the comments Mills Steele made in his article "Women Should Be Elegant": "At the outset some photographers may find it difficult to develop a distinctive style of portraiture. If this happened to me I would not have the slightest hesitancy about adapting another's style to my requirements. . . . Some photographers worry too much about originality. They place entirely too much emphasis on the value of novelty . . . unduc preoccupation with individuality in one's work has done a great deal to produce a crop of eccentric fakes.

"These attempts to be different solely for the sake of being different, are carrying art and photography away from tradition.

PSA Recorded Lecture Program

The Recorded Lecture Program of the Pictorial Division offers the following programs for your club.

No. 1. An Analysis of Recognized Salon Prints by Ragnar Hedenvall, APSA

No. 2. Commentary on Recognized Salon Prints by Morris Gurrie No. 3. Outdoor Photography by D.

Ward Pease, FPSA No. 4. Still Life by Ann Pilger Dewey, APSA, Hon. PSA.

No. 5. New Prints for Old by Barbara Green, APSA

SPECIAL Photography of the Nude by P. II. Oelman, FPSA

A deposit of \$25.00 should accompany an order. A service charge is made for each Lecture. The SPECIAL costs \$10.00 and should be ordered directly from Mr. Oelman. For clubs which are members of PSA but are not affiliated with the PD the charge is \$6.50. Clubs which are affiliated with the PD will be charged \$5.00. Clubs or groups not members of PSA will be quoted prices on request to the Director.

For Nos. 1 to 5 order from Philip B. Maples, Director, Recorded Lecture Program, 29 Spring Street, Brockport, New York.

For the SPECIAL please contact: P. H. Oelman. FPSA, 2505 Moorman Avenue, Cincinnati 6, Ohio.

To me tradition is our heritage of knowledge and experience. . . . It might not be too much to say that the creative master is not a success until he is imitated."

What then, is creative work? How can we create if we are not different? All of us have heard it said that there is nothing new in the world. What appears to be new, then, is the application of our knowledge of past situations to the present. Creativeness is a result of having a fresh viewpoint on an old subject.

It is not easy to imitate. Pure imitation is very difficult. If you were asked to imitate a picture, the chances are that you could not do it. For you would make some changes from the original. Some of the real "you" would shine through. You would not be imitating only-you would be creating a picture.

Artists, writers, architects, and most others in creative professions, keep a file of ideas. They may be pictures that others have done. They may be words which set off a chain of ideas. They may be rough sketches. But they are ideas.

Maybe you keep a file of salon pictures which you can use as starters for pictures of your own. Many photographers do. They imitate, maybe, but in imitating they create pictures of their own. For they change the elements of the picture, the arrangement of the elements, the lightingbut most of all they approach the picture they make with some individual difference in attitude. And they make a picture which is truly their own.

In summarizing, Mills Steele said: "Assimilate all you can through study and observation. Make your camera say things in your own way and you will soon discover that you have developed a style that is yours and yours only- as individual as your fingerprint."

Start now to develop your own creative abilities through imitation. Let your self shine through -- and your pictures will be truly your own. STELLA LENKS

Coming Salons Agreeing to Follow PSA Recommendations

NOTE: M-monochrome prints, C color prints, T-color transparencies, SS-stereo slides, L. monochrome slides, A-architectural prints, S scientific or nature prints. Entry fee is \$1.00 in each class unless otherwise specified. Recognition: The monochrome portions of salons listed have Pictorial Division approval. Check salon list of appropriate division for recognition of other sections.

Searching deep'r for the probable causes, we would find that the increasing shift to color photography by former print makers is only a normal result of two basic conditions, to wit: A desire to keep abreast of the times, to progress with photography; or an admission of the inability of the member to continue production of satisfying pictures in a monochrome medium.

The first condition is a healthy reaction in an era where science is achieving so much so fast.

The second may be caused by any of a number of contributing factors. "Time" could very well be the prime reason. With the advent of so many new and interesting diversions within our reach, most of us have discovered that the day is not as long as it was.

Perhaps the increased cost of producing pictorial prints is greater than the current print-making budget will allow.

The tendency of judges to find as little as possible of merit in each print may seem to some, insufficient reward for the effort involved.

Quite possibly the average camera club member wishes to make pictures the whole family, or his friends, can enjoy. How many of our non-photographic relatives or friends will look at prize winning prints and appreciate them?

Whatever the reasons, more and more print makers are turning to color. This indicates that they are still dominated by that indefinable urge to create beautiful pictures.

It should follow, then, that if they were consistent winners with pictorial prints, they will develop into color pictorialists having the added advantage of the technical experience necessary to all good photography. They will learn to create color, just as they learned to create pictorial prints. They will become greater photographers.

If clubs do not progress with color, if the die-hards persist in belittling color, they will be the losers.

Color enthusiasts are realizing that, today, it is their interest, their dues, and their winning of honors in color that keep most dual clubs operating, and they are beginning to rebel.

New organizations devoted exclusively to color are being formed by many.

One accredited international exhibition, heretofore jointly sponsored by a color and a B&W group, plans divorce because color entrance fees have had to finance the print section in the past two exhibits. Others may follow.

Any cleavage in groups with allied interests is bad. It will be unfortunate if continued shortsightedness by the few should widen the breech.

However, there is no loss without gain. Perhaps the die-hards will learn, through loss, tolerance for advancement. Surely those who accept both schools of photographic thought will gain a better understanding of pictorialism through continued demonstrations of creative monochrome technique translated into creative Color.

Forestry Building, State College, Penna.

Contests for All

Do Divisions of PSA fulfill adequately the desires of their members for contests and competitions in their specialized fields?

Speaking only for the Color Division, we can say that the enthusiasm for competitions has led to the development of four different contests available to all members either individually or through camera clubs. Most of these contests are well-established and are proving very popular. The enrollment in several has more than doubled in the past two years.

If you are not taking part in any of these competitions at this time, we suggest you check over the following list and get full information on any contest which meets your requirements.

Color Slides

International Slide Competition For Individuals. This competition consists of a series of five contests each season. Four slides may be entered in each contest. Medals and ribbons are awarded, but the chief value of this competition lies in the written criticism of each slide by the judges. Deadline dates are the 20th of September, November, January, March and May. The judging points are rotated. No entry fee for Color Division members, non-members pay \$1.00 for the series. For entry form write to Charles B. McKee, APSA, 5030 Del Rio Drive, Sacramento 18, California.

National Club Slide Competition. Competing clubs are divided into two classes. A and B. Five competitions in each group are held each season. Deadline dates are the 20th of October, December, February, April, and June. Each club enters 6 slides in each contest. There are prizes for clubs, and individuals as well as season grand prizes. No entry fee is charged for Color Division clubs, other PSA clubs pay \$4, non-PSA clubs pay \$6. Judging points are rotated. For information and entry form write to Merle S. Ewell, APSA, 1422 West 48th Street, Los Angeles, California.

Color Prints

Color Print Competition For Individuals.

This competition is composed of contests in November, February and May. Prints by any color process are eligible but must have been made by the individual submitting them. Cups and ribbons are awarded and each print receives a written criticism. There is no entry fee required of Color Division members, non-members pay \$1 per season, or 50 cents for each contest. For information and entry form write to Warren H. Savary, APSA, RFD \$2, Box 221, Plainfield, New Jersey.

Stereo

Competition for Stereo Workers. This competition consists of a series of three contests each season; four stereos may be entered in each. Medals and ribbons are awarded. Deadline dates are 20th of November, February and May. No entry fee for Color Division members, but postage for return of stereos must be included with the slides. For information and entry forms, write G. W. Blaha, APSA, 4211 Harvey Avenue, Western Springs, Ill.

In most contests, entries can be made in any one of the three or more competitions during the season, but in the club slide competition entries for the complete season are encouraged because cumulative scores are kept and annual prizes awarded for the top scoring club in each class.

In addition to competitions, many other opportunities are offered for appraisal of color slides, color prints and stereo slides through circuits and slide study groups for both clubs and individuals.—G. F. J.

"Oil and Water?"

The most discussed problem confronting camera club officers these days is the alarming drop in the number of prints being submitted since the admission of color slides.

Most of them decry "color" as the cause.

Yet, to blame this decline on "color" is merely generalizing, a sport generally indulged in by die-hards who refuse to recognize change as progress.

Their chief argument is that, whereas monochrome prints require great skill and multiple hours of work, "color" is only

More Information Coming

So many favorable responses were received to our September [351 special color slide feature in PSA JOURNAL, that we immediately made plans with the cooperation of the PSA Publications Committee and Fred Quellmalz, the JOURNAL editor, for two Supplements in 1952. One of these is planned for March, and the second will appear in September.

More information on color is the plan. To accomplish this we will need more members who will write their ideas and experiences for JOURNAL publication. The Color Division has an Editorial Committee which is contacting members and gathering information constantly.

If you have an editorial inspiration on color photography, contact one of the following: EAST: Paul J. Wolf, APSA, 354 Fort Washington Avenue, Hawthorne, New York; CENTRAL: H. G. Mitchell, 7455 North Greenview Avenue, Chicago 26, Illinois; WEST: Merle S. Ewell, APSA, 1422 West 48th Street, Los Angeles 37, California; GENERAL: Karl A. Baumgaertel, APSA, 353-31st Avenue, San Francisco 21, California.

Look at and Study Pictures

I wonder how many of us really study the pictures we see, and not just look at them.

If we are to improve our own work, we must study the work of others. This has been done for years by artists who always took the time and trouble to study the old masters.

I have found that when I look at a photography book, I get so much more out of it when I try to study the pictures. Take one of the pictures and see if it is pleasing to you and if it can be improved by cropping. Much to your surprise you may find that you can improve on it. By following this practice you develop a subconscious feeling for composition, and learn what really makes a picture click. Many of us are not blessed with an eye for composition, but don't be discouraged, as you can acquire this important requirement if you will study pictures.

When we are attending a contest we should listen to the judges' comments, and see if we agree. If they say it is good, observe what makes it pleasing and remember the picture. We can always pick up pointers we did not know before. In this way we get to recognize what gives a slide the necessary punch, and what makes other slides just average.

Therefore, by looking at all sorts of pictures at contests, exhibitions, in books, we learn whether a scene is worth taking or not, since in this manner we are developing what is known as a "photographic eye." Once we do this all that we have to do next is plan our composition, lighting and exposure.

It is the man behind the camera that counts, and not the value of the equipment that he is using. Study every picture you see, and pretty soon, much to your surprise, it will reflect in your work.— EDWARD HERCHE in New York Color Slide Club's Monthly Bulletin, "Rainbow".

Color Reproduction

"Is it possible to get an exact color reproduction of a color transparency which seems to match perfectly the subject photographed?"

This question was presented recently to W. K. Raxworthy, the Color Division technical authority on color processes. His answer follows:

From strictly theoretical considerations involving the mathematics of present day color processes, and from the present state of our knowledge concerning our visual sensations, it must be admitted at the start that no color process is capable of yielding exact color reproduction of the subject, and this holds for both transparencies and prints. In the case of color prints, the main reason for this is the faulty spectral absorption characteristics of the dyes involved, together with a somewhat inadequate visual response which varies with each individual. Prints which are good to some, are only mediocre to others, and the entire question is perhaps a matter of personal preference by visual examination and by our mental conception of what we think the original subject "looked" or should "look like."

The dyes are the best obtainable at the moment, but they fall considerably short of the theoretical requirements. The exception is the yellow, which fulfills the requirements to a remarkable degree. If the magentas and cyans did as well, practically all of the headaches in color reproduction would disappear. Fortunately, methods have been devised to offset much of the faulty absorption characteristics of the dyes.

The appraisal of color is an extremely complicated affair, and such attempts, visually, between a transparency and the original subject, or between the transparency and the corresponding reflection print, should be made with this fact in mind. All color prints will record the subject to a high degree providing the requirements of lighting, exposure, etc., have been met, and this record is constant. But our visual conception is not constant and will vary according to mood and with our mental idea of what we think the original "looked like."

A "true transparency reproduction" is therefore impossible for the reasons previously mentioned, and in addition, because of the manner in which the respective materials are viewed. In the case of transparencies, this is by transmitted light, whereas the corresponding print is viewed by reflected light and the two conditions are dissimilar. Unless the viewing light source is the same in each case, a considerable error in judgment is likely to result. A similar situation will result when viewing two "identical" transparencies or prints, each under different illumination. As a matter of fact, some of the colors may be altered completely if the required spectral components are weak or missing from the light source, as is true of some fluorescent and arc lights.

I believe the reader can now see why apparent or real color differences will always exist between transparency and subject, or between transparency and print. This, however, is no serious drawback,

since each can be acceptable despite their point for point differences when critically compared. Furthermore, our visual and mental equipment is such that we can make appropriate adjustment in all but the most obvious cases. In a good color print, however, the differences between it and the transparency should preferably be no greater than between the latter and the original subject.

Club Slide Contest Expands

With an increase of almost 20 per cent in enrollment in the National Club Slide Competition for 1951-1952, the division of the competition into three classes, of approximately 40 clubs each, instead of the two classes as in the past, is being considered at the time of this writing. classes would be Class AA, Class A, and Class B. Since a maximum of six slides can be entered by each club, this new classification will make the handling of the bi-monthly competition by a club somewhat less cumbersome and will give more clubs valuable experience in handling a The clubs entered this competition. season were polled on suggestions for action to take as a result of the substantial expansion in the competition. A preliminary tally of the poll indicates that the clubs favored increase in number of classes, rather than reduction in number of slides to be entered by each club.

New Record Set

With over 130 camera clubs enrolled in the National Club Slide Competition, a substantial new record has been set, according to a report from Merle S. Ewell, APSA, supervisor of the Competition. Last year, 108 clubs were entered. Five contests are held annually in October, December, February, April and June. No entry fee is charged clubs belonging to the Color Division.

Coming Color Exhibitions

Wilmington, Feb. 3-25, deadline Jan. 13. Four slides, \$1. Forms: Mrs. Don Tribit, 3 S. Lake St., Elmhurst, Wilmington, Del.

Chicago Nature, Feb. 1952, deadline Jan. 14. Four slides (up to 31/4x4), \$1. Forms: Blanche Kolarik 2824 S. Central Park, Chicago 23, Ill.

Vulparaiso (Chile), February, deadline Jan. 15.
Four slides, \$1. Forms: Carlos Quevedo, Club
Fotografico y Cinematografico de Valparaiso,
Avenida Pedro Montt 1740, Casilla 1907, Valparaiso, Chile.

Birmingham (England), Feb. 9 23, deadline Jan. 19. Four slides, \$1. Forms: E. H. Cochrane, 142, Swanshurst Lane, Moseley, Birmingham 14, England.

Minneapolis, Feb. 12:14, deadline Jan. 21. Four slides, \$1. Forms: Warren Anderson, 123 S. 7th St., Minneapolis, Minn.

Whittier, Feb. 10-24, deadline Jan. 26. Four slides, \$1. Forms: Arthur W. Maddox, 12020 Orange St., Norwalk, Calif.

Philadelphia, March 8-30, deadline Feb. 16. Four slides, \$1. Forms: Clarence A. Rossman, 1637 S. 54th St., Philadelphia 43, Pa.

Rochester, Mar. 7-30, deadline Feb. 14. Four slides (Including 234) \$1. Forms: R. F. Edgerton, 11 Fireside Dr., Rochester 18, N. Y. San Francisco (Photochromers), Mar. 15-22, deadline Mar. 1. Four slides, \$1. Forms: B. H. Ladensohn, 3140 Clay St., San Francisco 15, Calif.

El Camino, Apr. 29-May 30, deadline Apr. 12. Four slides, \$1. Forms: George E. French, 3877 Olmstead Av., Los Angeles 8, Calif.

GET SET UP...for a Happy New Year

For Taking...

Lighting often makes the difference between a good picture and an outstanding one; ease in control makes a big difference to you. If you really want to enjoy handling light, you'll need a versatile Kodak Vari-Beam Clamplight (left) or Standlight. With either, you dial the light you want, from high intensity spot to diffuse flood. No. 2 Photofloods in big 12-inch reflectors give you all the light you want.

Action shots and pictures in a hurry call for flash. For Kodak Flash Cameras or other internally synchronized types, the Kodak Flasholder, Model B, with Flashguard, ac-

cepts all midget lamps; a press of the button ejects used ones. \$10.55. Add a Kodak B-C Flashpack (\$2.95 less batteries) and make it a battery condenser outfit, free from

battery worries. If you use flash a lot, you want the Ektalux Flash System. For use with any camera, internally synchronized or with solenoid. With Extension units, fires up to 7 lamps. Ektalux Flasholder (above), from \$29.75. Extension Units, \$12.40.

For Showing...

Even if you already own a projector you will find plenty of use for a Kodaslide Table Viewer. Projector and screen are combined in a single compact unit, to give you brilliantly clear views of your color slides, enlarged to just the right degree for comfortable editing or for an intimate showing . . . without the need for rearranging furniture or room darkening. The Kodaslide Table Viewer, Model A (shown), includes a plunger-type slide changer and a slide holder with a capacity of 75 cardboard mounts. \$97.50. In the Kodaslide Table Viewer 4X, slides are inserted individually from the side. \$49.50.

For projection showings to larger groups,

Kodak offers you a choice of three Kodaslide Projectors. The Kodaslide Merit Projector with Kodak Projection Ektanon f/3.5 Lens and 150-watt lamp. \$26.10. Koda-

slide Projector, Model 2A, with either a 5-inch Kodak Projection Ektanon f/3.5 Lens, \$52.80, or a 7½-inch f/4 lens, \$63.45. Kodaslide Projector, Master Model, for 300- to 1000-watt lamps and with a choice of 4 lenses for home or auditorium. Priced from \$169 to \$246.

For Enlarging ...

There'll be plenty of wintertime pictures you'll want to enlarge. If you feel it's time for the best, you'll want a Kodak Flurolite Enlarger. Once you have handled its convenient controls, checked its deluxe features, you'll know you must have it. Cool, fluorescent light, in integrating sphere lamphouse, provides high printing brilliance, excellent contrast, casy focusing, minimizes negative grain. Two hand controls permit focusing and elevating at the same time. Rotating negative carrier tilts through 12 degrees for distortion control. Rigid tubular column, deepanchored in sturdy steel cabinet base; cabinet is lighttight for handy paper storage. With accessories, Flurolite can be used as a view camera, for copying, slide-making, mi-

crofilming, photomicrography, and cinetilling. Price, with one negative carrier, without lens, \$96.40. For a modest budget, pick the Kodak Hobbyist Enlarger. Has same type of light source, rotating negative carrier; knob locks head

firmly in position. Price, with one negative carrier and 89mm. Kodak Enlarging Ektanon f/6.3 Lens, \$42.40.

Prices are subject to change without notice and include Pederal Tax applicable when this advertisement was released for publication.

Experts' Choices For Fine Prints

No. 1 of an informative series on how leading exhibitors choose papers to fit their salon aims

Gottlieb Hampfler's "Pennsylvania Snowscape" has appeared in the Baltimore, Montreal, New York P.P.A., Philadelphia, Pittsburgh, PSA, Rochester, and Wilmington International Salons. The scene demanded a rich, full-scale print of delicate gradation and luminous image quality. To meet these requirements, Mr. Hampfler chose the most popular of all salon papers—Kodak Opal G, a fine-grained lustre surface on cream white stock.

He speaks of it as "the finest of media for my pictorial work—with characteristics I can always depend upon."

An experienced exhibitor, Mr. Hampfler prizes Kodak Opal Paper not only for its beautiful gradation and tonal richness, but also for its moderate speed which aids local printing control, its latitude in exposure and development for warmer or cooler tones, its responsiveness to toning, and its reliability.

KODAK OPAL's superb quality and its thirteen combinations of stock tint and surface texture have won it top billing among exacting workers. To accommodate negatives of varying scale, the Kodak group of fine papers offers alternate choices. One tempting alternate is the new, high-speed, warm-black, variable-contrast Kodak Medalist Paper—available in three surfaces and four contrast grades. Each grade can be made to yield a softer or more contrasty print —simply by varying the ratio of exposure and development. Medalist is about six times as fast as Opal; its surfaces are F (glossy), G (fine-grained lustre), and J (smooth, high lustre). The small reproduction at right is from a print on Medalist F.

PURPOSE and preference both help determine the medium—and there are Kodak papers to meet every need. For "Full Sail" (to appear full-page later in this series), Bernard G. Silberstein chose Kodak Illustrators' Special—a fine reproduction paper. For huge prints, Kodak Mural R is a natural choice. For extrafast production, Kodak Resisto Rapid N, which washes and dries in ten minutes. And for contact printing —each fine Kodak enlarging paper has a contact-paper counterpart.

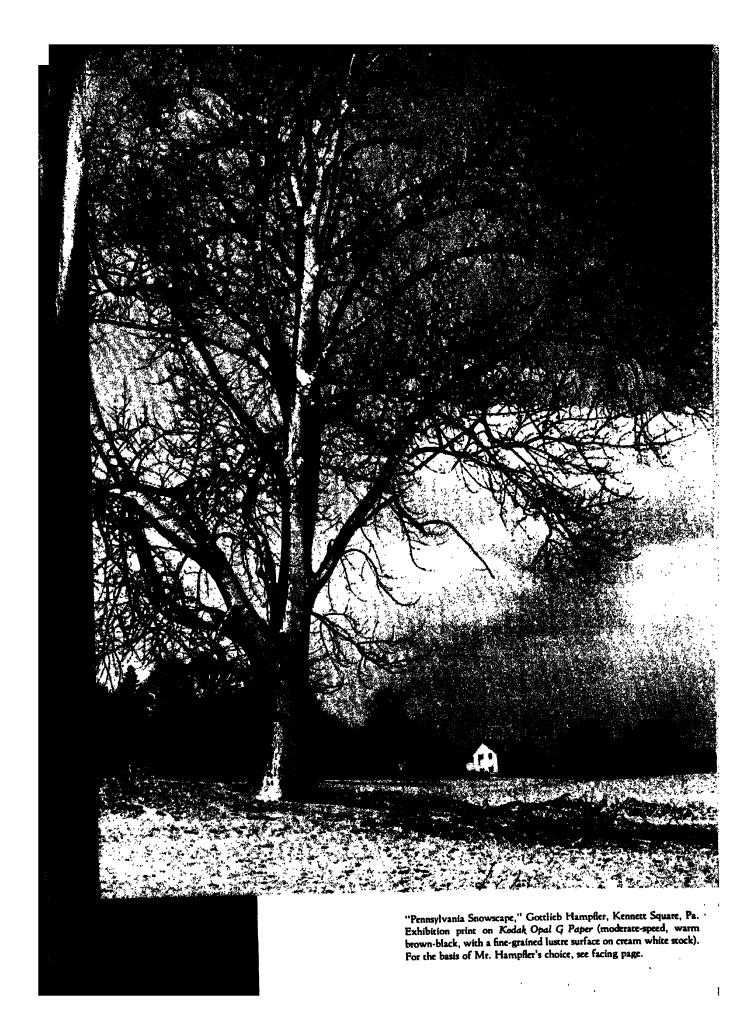

Know your Kodak papers, for knowledge spells success. For fine exhibition enlargements, gift prints, home decoration—choose from warm-black Medalist and Platino, brown-black Opal, Estalure G, and Illustrators' Special, and neutral-black Kodabromide. For special applications, Kodak Mural R, Resisto Rapid N, Opalure Print Film, Translite Paper. For contact prints, Kodak Azo, Velox, Resisto N, and others. Your Kodak dealer has full details.

Kodak

EASTMAN KODAK COMPANY, ROCHESTER 4, N. Y

Outdoors **PLUS** Indoors ...no better time than wintertime for a movie-making start!

"White" Christmas, or "green" Christmas... whether you live in a land of snow-clad pines or rustling palms... there's no time like the holiday season to start a movie-making career. Outdoors—and indoors—this is the time for exciting camera action... in color or black-and-white. For indoor movies are every bit as easy and as certain as shots made in sunlight! Two inexpensive flood lamps—and the fine, fast lenses on Kodak movie cameras do the rest. Camera prices are now lower... and movie film costs are probably far less than you think. Get the full story... at your Kodak dealer's.

Prices are subject to change without notice and include Federal Tax.

EASTMAN KODAK COMPANY
Rochester 4, N. Y.

BROWNIE MOVIE CAMERA

This is it! The new 8mm. Kodak Movie Camera that's capturing movie thrills for thousands of new movie makers... and with "Brownie" simplicity and economy. Its excellent f/2.7 Ektanon Lens is prefocused. You merely load (easy, sprocketless loading), check the built-in exposure guide, set the lens to follow accordingly, sight—shoot. Finger-tip exposure button locks so you can get in the picture, too. Has eye-level view finder, footage indicator. Weighs only 1% lbs. Makes fine movies—indoors or out, color or black-and-white—and only \$43.30.

CINE-KODAK RELIANT CAMERAS

You can choose from either of two handsome 8mm. "Reliants." Both have four different speeds including slow motion! The f/2.7 model never needs focusing ... and it's fast enough for most every lighting situation. The f/1.9 "Reliant" is twice-as-fast, focuses as close as 12 inches. Both models have sprocketless loading, enclosed eye-level view finder, exposure lock button, footage indicator, exposure guide—and accept a wide-angle converter plus accessory lenses. F/2.7 model, \$82.30; f/1.9 model, \$102.25.

CINE-KODAK MAGAZINE 8 CAMERAS

If you want the finest in the 8mm. movie field, one of these two great "Magazine 8's" is what you're looking for. Both cameras load in just 3 seconds —and you can switch film types... any time... without losing a frame. One model has a fine, prefocused f/2.7 13mm. Kodak Cine Ektanon Lens. The other model has an ultra-fast f/1.9 Kodak Cine Ektanon Lens focusing from 24 inches to infinity. Shooting speeds include slow motion. And there's a wide choice of accessory wide-angle and telephoto lenses. F/2.7 "Magazine 8," \$124.15; f/1.9 model, \$150.95.

Kodak

FINAL SCORES FOR DRIVES OF CHAMPIONS

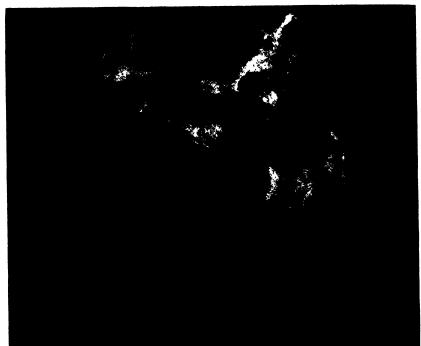

The following list shows the Grand Champion, District and Area Champions, and final score for each person participating in the drive.

The Committee wants to thank each person for his part in making the Drive of

Champions a success. Now that we have found how easily we can enlist new members for PSA, let's go ahead just as we have in the past. Watch PSA JOURNAL for an-nouncements about new awards for those who enlist new members.

The World's Most Versatile Line of Speedlights

ASCOR SPEEDLIGHTS

"Speedlights For Every Job"

MIDGET 80

The Midget 80 is an outstanding light weight portable speedlight designed specifically for applications where small weight and size is of extreme importance.

- Operates on either AC or self-contained battery.
- Weight 4 lbs. 12 oz. without battery; 61/2 lbs. with
- 3. Built-in charger.
- Condenser reforming circuit. Reforms the electrolytic condensers at same time battery is charging
 5. Only 12 oz. added to weight of camera. Light unit is
- small and compact.
- 6. Wide angle even coverage reflector.

Send for Complete Literature

Sold Only Thru J. G. Saltzman, Inc., 430 Lexington Ave., New York, N. Y. and other Authorized Dealers

AMERICAN SPEEDLIGHT CORP 480 Lexington Avenue . New York 17 N Y

Are you interested in nature, scientific, biological, or medical photography? If you are, this is an invitation to you to join the BIOLOGICAL PHOTO-GRAPHIC ASSOCIATION, INC.

The association (BPA) was founded in 1931 as a non-profit organization for the advancement of both still and motion picture photography in the biological and medical sciences.

Advantages of Membership

Members receive the BPA Journal

Members attend annual meeting where pictures and papers on the various techniques of biological photography are presented and discussed

Members view traveling salon prints for first hand study

Annual dues in United States only \$5.00; Foreign \$5.50

For your convenience, fill out application form printed below and mail with check or money order to Secretary Lloyd E. Varden, 533 West 57th Street, New York 19, New York.

Johnny Appleseed's Correspondence

Philadelphia, Pa.

DEAR JOHNNY:

Ran across an article in PSA JOURNAL, February 1951 issue in which some mention was made of BC flash, permitting use of several bulbs and positive synchronization. Would you advise me which issues of PSA JOURNALS gave information on building this unit, also where I might contain information of Don Bennett's Flash-Pak?

If you were a user of 21/4 x 21/4 negatives (Rollie) and you were going to buy an enlarger, what would be your preference-semidiffusion, double condensers, or diffusion—which would be considered best for salon work?

M. R. PRESTON

DEAR MR. PRESTON:

Contrary to original plans, we have devoted recent columns to items of more immediate and general interest than B-C flash. If vou will write to

> National Carbon Division Union Carbide and Carbon Corporation 30 East 42nd Street

New York 17, New York requesting Bulletin #5, I believe many of your questions on B-C flash will be answered.

You'll find information that should lead you to a safe decision on enlargers by studying columns 12 and 13 in the December 1950 and February 1951 JOURNALS. You'll probably conclude that a single condenser enlarger will best suit your purpose because it can be modified to give diffuse prints by using black tulle as described there. Watch your negative development when using a condenser

JOHNNY APPLESEED, APSA

Chicago, Illinois

DEAR JOHNNY:

I have taken a few shots of a favorite spot of mine to show the change of seasons. This is on Kodachrome film 828 size. One could be a salon shot I feel sure only-it should be in capital letters-ONLY it needs a figure in it.

In black and white this would be easy but color I don't know

the best method. Can you help me?

Maybe some of your readers may be interested to know that if you use a sheet of projection paper in your camera in place of film the resultant paper negative will have less grain than making one in the usual manner. Of course, glossy paper is preferable. The exposure I find is 6 times greater than Verichrome

JOSEPH C. WELLS

DEAR MR. WELLS:

Have you tried double mounting to solve your problem? This can be done by exposing a piece of Kodachrome with the figure properly placed for your "only" shot. Use a light colored (preferably white) background for the figure, so the background won't interfere with your good shot. Light the figure the same way the original was lighted, that is, with the sun in the same position. Then mount the films, one over the other with each in the proper place. Study proportions too, so the figure will be the right size. Possibly some member has a better idea.

JOHNNY APPLESEED, APSA

DEAR JOHNNY:

I followed your technic last summer of specializing on ortho (Verichrome) film entirely and with careful exposure using the latitude of Kodachrome. I developed in D-76-a three year old bottle-15 minutes at 75°. The contrast is beautiful. Nothing is blocked up, and the shadows have tone. The negatives are thin, have very little grain and print beautifully on normal paper.

I also shot a lot of Kodachrome with the warm-up filter, in fog and drizzling rain and by careful exposure and choice of color composition have a fine selection of slides with no blank skies but delicate gray and blue. I used exposure technic to underexpose hy ½ stop.

RAYMOND R. LAPELLE

PSA Directory

VOLUME 18

NUMBER 1

JANUARY 1952

THE PHOTOGRAPHIC SOCIETY OF AMERICA, INC.
PHILADELPHIA, PENNSYLVANIA

DIRECTORY OF MEMBERSHIP

This alphabetical list of members was prepared by PSA Headquarters as of November 1, 1951. Names and addresses are followed by a code indicating LIFE and CORNERSTONE MEMBERS, Divisional affiliation and month and year of joining PSA. When no Division letters appear, it means that Headquarters has no record of affiliation with a Division.

Every effort has been made to insure the accuracy of the listings, but your cooperation in checking your own name, address, and Division is expestly requested. Errors can be corrected only with your help. Communications should be addressed to FSA Headquarters, 2005 Walnut Street, Philadelphia 3, Pennsylvania.

The code used is as follows:

---Cornerstone Member tt-Life Member

C-Color Division

M-Motion Picture Division

N-Nature Division

J-Photo-Journalism Division

P---Pictorial Division

T-Technical Division

Because of space limitations, all miscellaneous memberships, subscriptions, etc., have been omitted.

Extra copies of this Directory Section, separately stapled, may be purchased by members only from PSA Headquarters, 2005 Walnut St., Philadelphia 3, Penna., at 25 cents each in coins or stamps only, payable with order.

Use of this Directory for sales solicitation is made without the approval or sanction either of PSA or of PSA JOURNAL. PSA Members are reminded that it is impossible to provide the convenience of a membership list without risking its use for sales or other commercial purposes. Such use constitutes no endorsement by PSA or by PSA JOURNAL of products or services thereby offered.

THE PHOTOGRAPHIC SOCIETY OF AMERICA 2005 WALNUT STREET, PHILADELPHIA 3, PA.

"Ten years ago America's business publications, as a voluntary public service, presented for the first time advertisements outlining the Payroll Savings Plan for the regular purchase of U. S. Savings Bonds, and urged its acceptance. During the decade which has passed, American business has consistently supported the Payroll Savings Plan and made it a success. Continuation of this cooperation with the Treasury is most essential in the present emergency. Expanded sales of Defense Bonds will assist importantly in checking inflation, in preserving economic stability, and in furthering the over-all defense effort."

In ten brief years:

- From 700,000 in 1941 employee participation went to 27,000,000 at the peak of the war.
- Companies with Payroll Savings Plans jumped from 10,000 in 1941 to more than 175,000 during the war.
- Since January 1, 1951, the number of men and women on Payroll Savings has grown from 5,000,000 to 6,200,000.
- On September 30, 1951, individuals held Series E
 Bonds totaling \$34.6 Billion-more than \$4.6 Billion greater than on V-J Day.
- In the January-September, 1951, period, 33,418,000
 \$25 E Bonds were purchased—a gain of 17% over the same period of 1950. 8,966,000 \$50 E Bonds were sold in the first nine months of 1951. \$25 and \$50 denominations are the bonds bought by Payroll Savers.

Congratulations to the executives of industry and the publishers of business papers for their continuing effort in promoting systematic savings through the Payroll Savings Plan—the plan that protects America and Americans.

The U.S. Government does not pay for this advertising. The Treasury Department thanks, for their patriotic donation, the Advertising Council and

KALART
B-C FLASH
UNIT WITH
BUILT-IN
TEST LIGHT
NOW \$14.30

Why is B-C the greatest improvement in flash photography since Kalart first invented the synchronizer? How does Kalart's exclusive built-in test light keep you from missing flash pictures?

This new Kalart B-C Demonstrator tells you — in a flush. Look for it at leading photo dealers. Try the test light yourself. Notice when you press down on it that it gives a brief flash. That tells you two important things. The battery is O.K. The flash lamp is O.K.

Think what it means to be able to check

these two points instantly—before taking each flash picture. You save time, temper, and money. You stop missing flash pictures.

money. You stop missing flash pictures.

To get the full benefits of B-C flash photography, get a genuine Kalart — the *only* B-C flash equipment with built-in test light.

Kalart B-C flash units are available for cameras with or without built-in synchronization. For cameras with built-in sync, \$14.30 complete. Series wired flash extension units, with 20 feet of rubber covered wire and spring clamp, \$9.85 each.

Controlled Light...

Kodak VARI-BEAM LIGHTS

There are few indoor pictures that can't be lighted efficiently with the Kodak Vari-Beam Standlight and its companion, the Kodak Vari-Beam Clamplight.

In either, the light beam is completely adjustable, from broad beam to extra narrow beam, by a simple twist of the wrist. With such fine control you can bring out the desired texture, roundness, or modeling of any subject.

The big 12-inch reflectors, designed for No. 2 flood lamps, have a semi-matte, anodyzed aluminum surface. A round 4½-pound base on the Standlight gives ample stability, and a rubber rim prevents floor marring. The telescoping aluminum column is adjustable to heights from 3 to 5½ feet with a convenient thumbscrew to lock it in position. On the Clamplight is a C-type clamp that can be quickly attached to flat or tubular objects. Both have a handy, always-cool handle for aiming the lamp, and a clamping knob to hold it in position.

See the Kodak Vari-Beam lights at your Kodak dealer's. While there, ask also to see the Kodak Ektalux Flasholder.

Vari-Beam collar permits selection of spot or flood or any intermediate light spread.

Kodak Vari-Beam Standlight \$16.00

Kodak Ektalux Flasholder—\$29.75 to \$33.85—with accessories and extension units provides a B-C flash system for all professional flash requirements.

Prices are subject to change without notice.

EASTMAN KODAK COMPANY, Rochester 4, N. Y.

JOURNAL

زم

CEDDILA DV 1050

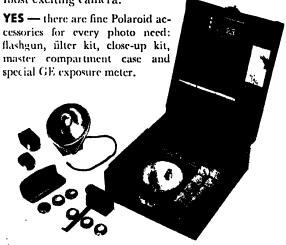

You'll find exciting new camera adventures with 60-second photography, because there's never a development problem. And no matter where you use it, you'll be delighted with the *quality* of the big, brilliant black-and-white prints produced by your Polaroid *Land* Camera in just one minute.

SHORT CUT TO PICTURE PERFECTION—When you use a Polaroid Camera you start with a fine precision instrument... and then you discover that the picture-in-a-minute principle makes possible an amazing improvement in your own artistry. Because you see your results on the spot, you get a "second chance" which no other camera can give you. If you're not perfectly satisfied with the pose, the lighting, the camera angle, you can shoot again. With a Polaroid Camera you can be a perfectionist... without effort!

SURE-FIRE SIMPLICITY — Never before has so fine a camera been designed for such simple operation. It's easy to load . . . just drop in the film. Easy to use . . . a

single control sets lens and shutter. It's easy to remove the 3¼" x 4¼" black-and-white print from the back of the camera, and easy to get fine enlargements and copies through your photo dealer. ASK FOR A DEMONSTRATION — 60-second photography is a *new* experience . . . words alone can't tell you how satisfying it is to see your pictures as you take them. You've got to try it! Your photo dealer will be glad to arrange a demonstration. You'll wonder why you ever waited . . . to see your pictures and to own the world's most exciting camera.

THE PRESIDENT REPORTS . . .

The "Tops" show was held in Montgomery, Alabama, on January 20, and in Memphis, Tennessee, on the 26th and 27th. It will be in Phoenix, Arizona, through most of February, and then will go back to Louisiana and Texas after Easter.

As this is written before any of those dates, I cannot report on what happened, but having seen the prints and slides as Chairman Paul Wolf sent them out, and knowing the enthusiasm and ability of the local committees, I'm certain that the deep South and the Southeast have a better idea of what we in PSA mean to photography and what PSA can do both for its individual members and for the general level of photographic interest in their communities.

Important as "Tops" is to PSA and to all the members in whose home towns it is staged, it has another angle which, to me, has an even greater value. Some one of these days-and maybe sooner than most of us are likely to think-there will be local PSA activity all over the country. Few members will live more than a couple of hundred miles from a regional center where there will be four or five really worth-while programs every year-programs in which all the members within the region will participate and which will serve both to improve their status as photographers and to give them an opportunity to get to know all their fellow PSA'ers.

But all that has an element of "future". Far nearer is the New York Convention which will open on Tuesday this year with one of the longest forward steps PSA has taken. It is a symposium on "Photography in Biology and Medicine" to which all amateurs and professionals interested in that most specialized type of work are invited. That is on Tuesday, August 12.

On Wednesday there will be another symposium on "Photography in Science and Industry"-again a program of great interest to amateurs and professionals, PSA'ers and non-members alike. Tentative plans also include further sessions on the educational and publishing fields. It's going

to be a big show with fun and technique mixed together.

Incidently, right now is a good time to start convincing the boss that mid-August is the ideal time for your 1952 vacation and New York the ideal place. A quarter of a million visitors come to New York each week throughout the summer to take pictures and otherwise enjoy the city. We, at the Convention, will have the advantage of air-conditioned meeting rooms at the New Yorker as well as everything else the metropolis has to offer. In addition there may be trips by air or boat before or after the Convention--trips you ordinarily might not take because of the added cost of transportation from home to starting point. The JOURNAL will carry the details.

Take a look at page 28 of the February issue of "Photography". It is most gratifying to know that the Editors regard our news as worth printing.

Now for something less pleasant. PSA as a whole is doing a fine job and has for a long time, but there are a few holes in the picture-holes that are being eliminated as rapidly as possible. The beginning of such elimination lies with the members who point out our weak spots. Then the responsible officers try to work out plans that will fix the trouble area and handle the problem involved as it should be. (Please regard this as an invitation to show me where we ought to make changes or to point out an area of weakness. I'll do what I can.)

Right now the District Representatives are working under a new system to keep in touch with the members who are late in mailing their renewal checks. In the near future, they will have a bigger hand in welcoming new members-a bigger part in most of the Society work. Those DR's are important in PSA. Do you know yours?

Now a hurry-up! Because of the early Convention date, there is not too much times to send in applications for Honorsthe deadline is March 1. Get your blanks

Remember to let me know what you want PSA to do.

NORRIS HARKNESS

Natchless SCOPE ...

If you are looking for the ultimate in a camera—the 21/4 x 21/4 HASSELBLAD merits your interest. This is particu larly true if you pursue your photo graphic work, and pleasure, with the practised discipline of a perfectionist For here is an instrument, crafted in Sweden, with built in refinements that will bring to your picture making a matchles new scope a new sureness Interchange able lenses, interchangeable roll film magazines, automatic controls, speeds to 1/1600 second built in flash - these are but a few of the features that make the HASSLLBLAD a "must" for your personal inspection

Prices — The camera, with 80 mm Kodak Fktar f 2.8 Lens and 2^{1} (v) volinim magazine, \$535. including Tederal lax Accessors 135 mm Kodak I ktar f/35 Jens, \$250. and 250 mm (10 in.) 7c144 Opton Sonnai lens f/4 \$121.

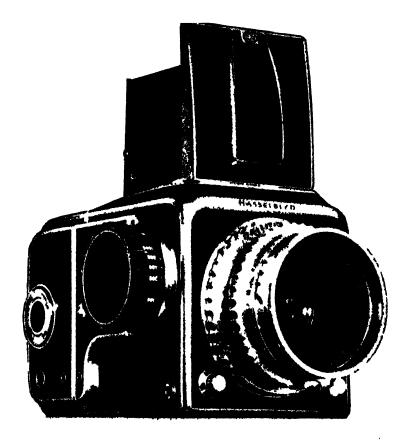

Endless **APPLICATIONS...**

Wherever your photographic pursuits may lead you whatever your favor ite subjects may be - the HASSFL BI AD (amera will make a strong bid for your attention Its applications are its great capabilities are equal to the most exacting require ments in any photographic field

110 West 32nd Street New York 1 N Y

NATURALISTS will appreciate the close working sharpness of the matchless Fktar f/2 8 I ens focusing down and to full scale with to 20 inches extension tubes without parallax

PHOTO RFPORTERS will be quick to exploit the dazrling 1/1600 top speed of the HASSFI BLAD excited at the prospect of freezing action at angles too difficult for slower shutters

II LUSTRATORS will like the quick interchangeability of the roll film mag permitting the use of differ ent film emulsions color or black andwhite, in one camera

SPORTSMEN will thrill at the "reach of the telephoto lenses that bring distant, inaccessible subjects into working range thanks to rapid interchangeability of the lenses

insist on the BEST if you want best results Use an OMEGA D-2 Enlarger

Only Omega's optically correct condenser system matches auxiliary condensers with the focal length of each lens... assuring you uniformly brilliant prints and maximum enlargements with each negative size from 35mm to 4"x5". Only Omega gives you all these features: sturdy incline girder construction for added durability; ventilated lamphousing for super-cool operation; counter-balanced head for finger-tip performance; and turn-micrometer mechanism to provide accurate focusing. Insist on the BEST—OMEGA!

OMEGALITE for less contrasty prints, replacing the standard condenser lamphouse of the Omega D-2.

New Aids for Better Picture Making

JACOB DESCHIN, APSA

THE MAKERS of the famous Victor line of light units, James H. Smith & Sons Corp., of Griffith, Ind., apparently are launched on a program of providing amateur photographers with a new line of low-cost lighting equipment. Four items recently announced by the company should sound a responsive chord in many an amateur who wants to try making pictures indoors but is reluctant to spend too much money on the needed equipment.

The Smith people offer four items that should be easy on the pocket. One is the Victor Floodlite Kit, a three-light beginner's outfit selling for \$9.85. The kit includes two clamp-on deep-necked 10-inch reflectors, with No. 2 photoflood lamps, for main lighting, and a clamp-on cone-shaped reflector with a No. 1 lamp for back, high, or other lighting accent. All three units have heat-insulated Bakelite sockets and a bright red directional handle for controlling lighting angle. The complete outfit fits in a red cardboard carrying case with handle.

The three other outfits are the Victor Flood-Master, a three-light device with a bracket that attaches to any movie camera,

sends light from above the lens, may be rotated and tilted, accommodates reflector-flood lamps and costs \$9.95, with case but without lamps; the Victor Bar-Lite, \$5.95, a two-light bar with core clips on the back of the case for winding up the cord when the bar is not in use; and the Victor Tri-Flood bar for three reflector-flood lamps, which mounts on a regular light stand and costs \$7.95.

In the flash field PSAer Myron Jenner has helped the cause of the budget-minded with a low-cost version of the Jen B-C flashgun originally designed for the Leica camera at a much higher price. His company, Jen Products, Inc., 419 West Fortysecond Street, announces the new gun as the Jen B-C Pocket Flash. It has all the features of the higher-priced unit plus new ones and costs \$14.95. When collapsed in its carrying case, the new gun is no larger than the reflector itself. The complete unit, which weighs eight ounces, includes a battery case, reflector, shutter cable, condenser, battery and carrying case. The Jen B-C Pocket Flash may be used on any camera with built-in synchronization simply

by changing the mounting shoe or by using a bracket.

Cameras

By the time you read this, there should be on the market a telephoto lens for the 35mm Argus C, C2 and C3 miniature cameras. The lens was developed in Munich, Germany, and is being imported for the American market by Geiss-America, Chicago 45. The company will also be the sole distributor of the lens in this country. The lens is the 100mm (4-inch) f/4.5 Tele-Sandmar, said to be a true telephoto with four coated surfaces, and costs \$69.50. The Tele-Sandmar is in a helical focusing mount; is coupled to the rangefinder; has a depth-of-field scale from three feet to infinity; click diaphragm stops; a built-in sunshade and filter holder; and attaches to the Argus camera in a few seconds, we are told. All readings and markings are on top.

A lighting unit for the medical photographer has been introduced by Walden Industries, Inc., 350 West Fiftieth Street, New York. It is the Quick Clix clinical photography unit that attaches to nearly any rollfilm camera and incorporates atthe-camera speedlight flash or regular flood lighting. A special model with fully automatic aperture control is available for 35mm single-lens reflex cameras.

The new model Praktica 35mm Reflex, with Zeiss Tessar f. 3.5 and built-in automatic diaphragm, has been imported by Ocean Photo Supply, 11 West Twentieth Street, New York. With eveready leather case, the camera is \$117.50. The camera with f/2 Zeiss Biotar lens and case is \$156.50; with f/1.9 Meyer Primoplan lens and case, \$145.

The improved German-made Iloca Stereo II, imported by Ercona Camera Corp., 527 Fifth Avenue, New York, now has a new frame size, 24x23mm, which permits a yield of thirty stereo pairs from the regular 36-exposure roll. Matched Ilitar f/3.5 lenses have a shortened focal length of 35mm. Other features are: all controls visible from the top; focusing through a center wheel; twin Prontor-S shutters with speeds to 1/300th; delayed action self-timer; flash synchronization and hinged, detachable back. The price is \$125.

Bolsey Research and Development Corp., 118 East Twenty-fifth Street, New York, has developed a camera for the Air Forces that automatically starts taking pictures the moment the pilot starts firing his guns. The camera is the N-9 Combat Recording Camera, a remote-controlled picture-taking unit that is about the size of a hand and uses 16mm film in 50-foot magazines. Settings for different light conditions, hazy, dull or bright, can be made by the pilot on the remote control instrument box set on the dashboard of his plane. A flip of the finger does it.

"In order to have a record not only of the actual shooting, but also of its results," the company states, "the camera has an overrun—it continues to shoot pictures a few seconds after the actual firing stops. As a result, a record is made of enemy planes shot down, targets hit on the ground, take it easy-with stereo-Realist

TAKE WHAT YOU SEE...THEN SEE EXACTLY WHAT YOU TAKE

ALTHOUGH experts find new photographic thrills in the true-to-life realism of Stereo-REALIST pictures, you don't have to be an expert to enjoy the REALIST camera. People who never before used a camera find it amazingly easy to take exciting pictures in beautiful natural color and in three dimensions with the REALIST.

The reason is simple. If a scene is pleasing to your eyes, snap it. The resulting picture seen in a REALIST Viewer will be equally pleasing because it is an exact duplicate of the original scene . . . in full color and with breathtaking depth.

With the REALIST you don't have to fuss about perspective or composition... or juggle a truckload of equipment. And in third dimension people are so lifelike you almost expect them to speak... scenic views are indescribable in their grandeur.

But you have to see REALIST pictures to appreciate them. Ask your dealer to show you some. Prove to yourself that you, too, can "take it easy" with the REALIST. DAVID WHITE COMPANY, 387 W. Court Street, Milwaukee 12, Wisconsin.

BULK-LOADING AIDS

Under new tax laws the levy on most roll film has been increased from 15 to 20%. However, on 35 mm. bulk film sold in lengths of 25 feet or over, the tax has been removed completely. This means that Leica photographers, by using bulk film, now can save 20% on the tax alone.

And even more important, far lower list prices on bulk film allow additional savings of as much as 56%.

To help you make the most of these major film economies, Leitz offers a complete selection of precision accessories for loading with bulk film . . . including the basic trio shown at right.

With them, home-loading is simple, quick and foolproof. And your savings on the first 100 feet of bulk film you buy, more than pay their modest cost!

Look them over at your photo-expert Leica Dealer's. And if you don't already own a Leica camera, look into the countless other ways that Leica makes better pictures easier for you.

Also ask about new tax-reduced prices on many items in the Leica family of over 200 camera accessories.

LEICA MAKES BETTER PICTURES EASIER

and serves as an actual visual record of what transpired during the action."

Designed to cope with the high speeds of jet planes—relative speeds of 1,000 miles per hour are commonplace in aerial combat—the N-9 has a shutter speed, operating up to 64 frames per second, that is equivalent to 1/1000th of a second exposure.

In the motion picture field, the announcement is made of an improved Pathe 16 camera, imported from France by Director Products, Inc., 570 Fifth Ave., New York. The \$395 camera (less lens) has a full frame focusing device which permits sighting through the lens while actually taking movies. Other features are an improved governor and threading mechanism; pressure pad and release button; and a full scale of six frame speeds up to 80 frames per second for extreme slow motion. The spring motor permits shooting thirty feet of film per winding; the hand crank is built in.

Accessories

Three items are offered by a new company, the H. L. Instrument Co., 313 W. Valley Boulevard, San Gabriel, Calif. One is a metal filter holder for Varigam filters, the Enlarg-O Filter Holder that attaches with three adjustable set screws to enlarging lenses of various diameters up to 17/8ths inches. The price is \$2.95. Another is the Enlarg O Arm, an extension aperture control that permits the operator to preset for a desired aperture, then open the lens wide for easier focusing, then re-set quickly to the predetermined stop. The metal item is \$1.95. The third device is the Treasurscope, a \$1.50 viewer for stereo slides.

Tiffen Manufacturing Corp., 71 Beekman Street, New York, which is noted for the ingenious filter-carrying devices it puts on the market from time to time, now appears with another. It is the Select-a-Filter Safe, a transparent plastic filter case with a novel push button filter selector. The case has a snap closure, molded strap loop for attaching to a case or carrying bag, holds six filters, lens shade and adapter ring, and costs \$2.50 for the Series V, \$2.75 for the Series VI size.

An improved Slavey 1-0-1 unit for firing several lamps simultaneously with the master flash has been placed on the market at \$17.95 by Sterling-Howard Corp., 561 East Tremont Ave., New York. According to the announcement, flashes can be made in any combination of strobe or flash lamps from 150 to 300 feet without interconnecting wires.

The DS surface, velvet grain natural white, high lustre in double weight, has been added by Du Pont to its list of Varigam surfaces, bringing the total to ten.

Literature

TO PSA MEMBERS EVERYWHERE

From Paul Gibbs. Chairman, PSA '52 Convention

August 12th through 16th are dates for you to note and remember for during that period New York City will be the host to your 1952 PSA Convention. More than 100 committee members are already busily working to make the Convention an event unmatched in both photographic importance and genuine hospitality.

New York City has been described as "The World's Largest City," "The City with Highest Buildings and Miles of Subways," "Center of World Government," "The Harbor of the Largest Ships" and many other descriptive titles of a "super" nature. Your convention committees are more chiefly concerned, however, that you will enjoy and appreciate things about our town that are of far more importance and value. We want you to know and feel the real sincerity and warmth of our welcome to the '52 Convention. We desire above all else, after the Convention is over and you are enroute home, that you will take with you a feeling of having personally experienced hospitality unsurpassed.

Photographically, nothing will be left undone. The Convention program will give fullest consideration to each and every PSA Division. It will be outstanding in quality and justify your full interest.

The August dates will permit your attending without disrupting seasonal club activities and also provide you with both a new and complete menu of photographic pictures, facts and data that will give greater impetus to your plans for the home club programs during the following season. The August dates also provide greater freedom to many, who otherwise would have to remain home because of business and school sessions. August is the month of vacations and there are few places in the world that can equal New York's appeal or facilities for recreation.

You will be comfortable. Out of doors the weather will be ideal for field trips and visits to the hundreds of photogenic spots. Indoors, the Convention will be held at one of America's famous hotels—The New Yorker. All of its public rooms are completely air conditioned and its facilities are so vast that all of the PSA Exhibitions can be displayed under the same roof with the other programs.

Above all, every effort will be made to personalize the New York Convention by catering to the needs and interests of the individual.

Do you have a transportation problem? Write us and we will supply complete information regarding your travel, whether by car, bus, rail, plane or boat.

Would you like to visit or photograph such places as the United Nations, St. John's Cathedral, Chinatown, the world-famous airports, Jones Beach, Coney Island, Rockefeller Center, the Bronx Zoo or Central Park? Notify us and it will be arranged.

Would you like to visit the "Roaring Forties," Greenwich Village, a Broadway Show, a television or radio show? Your convention committee will take care of your slightest wish. You will find them willing and anxious to be of assistance.

Yes, whatever your need, be it but a directive to the best places for shopping or the securing of a baby sitter, we will do our utmost to render truly personal service.

We urge you to make your plans now to attend. We will have a wonderful time together. You will like our town and everything possible will be done to make you feel at home. Don't forget, its

NEW YORK FOR YOU IN '52.

various fields, and will be supplemented by an extensive program including lectures, demonstrations and film shows. The Photokina exhibition is primarily a trade show supplemented by photographic and educational displays.

A new feature of the greatly enlarged quarters of Peerless Camera Stores at 415 Lexington Ave., New York, is a department for scientific and medical photographers, the first of its kind in a photography store. The department is manned by specialists in the field and the equipment on display includes a line representative of all the principal manufacturers of this type of equipment.

And just as we were winding up this shop talk an announcement came from E. I. Du Pont de Nemours and Co., Inc., of Wilmington, Del., of a new synthetic base for photographic film. "Preliminary tests by Du Pont Research," the announcement says, "show that it is several times tougher and has much greater dimensional

stability than any of the present types of film base." The base is a safety type and is less flammable than present safety bases.

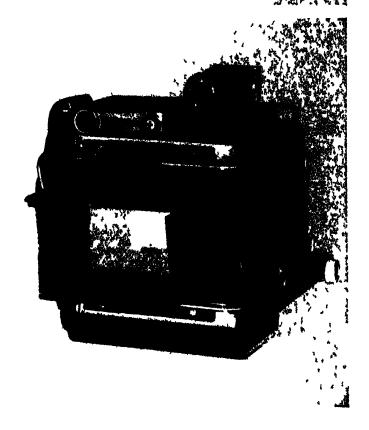

The company emphasizes that the new material is still in the research stage, although five years of research and an investment of more than one and a quarter million dollars has already gone into its development. Even if it meets all tests it will take another two years or so to design and complete manufacturing facilities.

So, for the record, be it known that the material, which is intended for motion picture use, has "twice the tear resistance of the standard acetate or nitrate base film, and can be run through a projector from three to four times as long before perforations show appreciable wear." Known technically as polyester film, the material, according to Du Pont, may make it possible to reduce the thickness of motion picture film by at least 20 percent. The base is noted also for its dimensional stability and its lack of brittleness at low temperatures.

THE GREAT GRAFLOK BACK

...makes a GRAPHIC grow with your skill!

In the back of your Pacemaker Graphic, you'll find many of the reasons for its ability to cope with virtually any photographic probfrom sports to studio work landscapes to scientific and industrial picturemaking! It's the famous GRAFLOK BACK of course the back that allows your Graphic to grow to fit your own particular skill Now standard equipment on all Graphics, the Graflok Back can be bought separately (from \$13 95) and be fitted to earlier models Among its many other advantages. Graflok gives you a greater flexibility and choice of film than ever before . . . and below are some of the versatile accessories it accepts The Graflok Back comes in all sizes of Pacemaker Graphics, of course!

A portrait of the author, wearing his specially-designed diving helmet.

W ITH ONE last admonition to Don to keep the air pump going steadily, and a warning to Bob to let me down very slowly, I popped my head into the 65-pound diving hood resting against the side of the boat, gave a signal to be lowered, and offered up a fervent prayer that these two Bahamian students of mine would follow my instructions to a "T." Thus began my first trip down into the warm crystal clear waters of the Bahamas. Some few seconds later, I was rudely jarred to a stop, and found myself seated upon the hard sand with 30 feet of water above my head. The pain in my ears was terrific. Bob's idea of slowness appeared to be rather distorted.

I gave one hard yank on the line to the helmet, the pre-arranged signal to be pulled up. Rope came down. I repeated the signal to find more rope coming my way. I started pulling it down, hand over hand, and finally discovered the main sheet of the boat in my hands. Finally, with yards and yards of rope floating above me, like a thousand ugly snakes, the line tightened and I was able to pull myself to the surface. There I found two very embarrassed boys who tried lamely to explain how they got their signals crossed. So ended the first of many, some routine, some dangerous and many humorous experiences that are attendant to taking color movies underwater.

Many problems had to be solved before it was possible for me to produce my first successful underwater color picture. One of the initial difficulties is teaching oneself how to dive properly. Everyone said it was easy, but I was soon to realize that to be safe underwater while you

JOHN F. STORR, M.A.*

Some Experiences in

were concentrating on photography, meant that many difficult little problems of diving had to be learned to the point of being automatic like driving a car. These included regular breathing, balancing against tide and wave motion, judging distance to counteract the magnification aspect experienced in viewing objects under water, and many others. My first photographic problem was to get the camera safely underwater and keep it dry during filming.

The Bahamas have long been both a Utopia and a

The author prepares for an underwater photographic session near Nassau, Bahamas.

Valhalla for many underwater photographic experiments. Probably the most successful of these has been the Williamson photographic tube. I took one look at this huge tube, with its round sphere and four-foot glass port mounted on a barge-like boat, and realized this was not for me. My underwater spear-fishing experiences had brought me to the conclusion that the most colorful

^{*} Instructor, Biology Department, Adelphi College, Garden City, L. I., New York.

UNDERWATER PHOTOGRAPHY

A MOTION PICTURE FEATURE

scenes could be taken in relatively shallow waters, 15 or 20 feet deep, among the treacherous coral heads within the coral reef itself. Only a small dinghy could be maneuvered in such an area and then, only in the calmest of weather.

My first serious attempt to make an underwater photographic unit was the construction of a diving bell made from part of an 18-inch cylindrical tank, equipped with three adjustable legs. With the enthusiastic support of a number of my students, some of the workmen in the shipyard, and the skepticism of the yard boss, "The Bell" at last stood proudly on its three legs, its foot-square glass port glistening, like the one-cycl giants of Sinbad's tales.

Proudly we carried its 200 pounds of weight to the end of the dock, lowered it gently(?) into the waiting dinghy, and gently again heaved it over the side. It floated serenely, its one eye still balefully gleaming. We added another hundred pounds of weight to its legs and, with a sigh, "The Bell" sank with me beneath it, my shoulders cramped within its confines. This ducking was its baptism and I believe it still stands in the shipyard waiting patiently for its second trip into the "Briny."

Following this, a series of successful photographs were taken, using a butter-box with a glass top, which was placed in the water over the side of the boat. The camera was poked into a small hole at the back of the box, and the picture snapped as interesting scenes came into view through the glass plate. These pictures were made on black-and-white film but proved to my satisfaction that color pictures were feasible and practical, as a lens opening of f/11 and a shutter speed of 1/50 was used, and

the pictures had great clarity and good exposure even when objects were photographed at a distance of 30 feet.

Underwater Lighting Conditions

The other major problem to overcome was the quantity and quality of the underwater light. Getting a light meter underwater to measure quantity of light was easy. An ordinary preserving jar was fine—until I decided to take pictures at fifty fect. I felt it was then time to build a rectangular plastic case of 3%-inch clear plastic to hold the light meter. It didn't float, was easier to manage, and gave better protection for the meter. Glass breaks too easily under water.

Underwater lighting seemed to be very unreasonable and senseless at times until I realized that there were really three sources of light to be considered. The overhead light, the sun rays refracted by waves, and those reflected from the bottom. The direct rays of the sun are absorbed by the water fairly quickly. The light rays refracted by the waves are affected in the same way. The only reason for making any differentiation at all is that near the surface the refracted rays are responsible for a brilliant lighting effect because there is not too much distance to travel through the water. The light therefore is very diffuse and strong. At fifty feet these refracted rays are ineffective and at any distance are lost entirely. Photographs at this depth show the effect of direct overhead lighting only.

On studying my first hundred or so pictures it became apparent that the most important source of light to consider was from the bottom. As a result I have limited

Two heads of TRUNK coral (Orbicella annularis) raise their heads to a height of six feet. This is one of the star corals and its peculiar growth often leads to the "ice cream cone" appearance. Their sides are covered with ZONARIA algae and a large YELLOW SEA FAN. This photo was taken in about 20 feet of water.

A BUSH CORAL, one of the GOR-GONIAS, with all the polyp animals extended has the soft appearance of velvet as it sways gently with the tide. In sharp contrast is the adjacent stark branch of a STINGING CORAL in which the polyp animals are very small.

A black LOGGERHIEAD or Rotten Sponge in the center is of greatest interest here. This sponge measured some two feet across. If, as a diver, you place your hand above the osculum, or opening, the powerful flow of water from the sponge can be felt. The great activity of the sponge is not often realized.

my pictures to areas where the bottom is sandy and light in color.

Several types of black-and-white film were tried but the best results were obtained with a Plus-X film and the use of a K1 and K2 filter.

Color photography presented a much more complex problem. The red end of the spectrum is quickly absorbed by the water and true color balance is impossible. I was not concerned, however, with true color balance.

A movie camera being loaded into the light-weight aluminum container.

What I wanted was an underwater photograph that looked like underwater and appeared in projection the same as the underwater appeared in real life. Besides the color of the water changes from hour to hour because of the color of the floating particles of rock and the kind and amount of plankton or minute floating plants and animals in the water. Consequently, the point of view of rendering the underwater scene in its natural condition is quite convenient. It required only one set of filters

ranging from light to pale rose. Without a filter pictures taken at a depth of over 15 feet are very bluish. With a filter it is possible to take good color pictures without a bluish cast to them at 50 feet.

About this time I had finally got it through my thick skull that light mobile equipment, with the camera encased in a water-tight box, was the answer to my need for maneuverable equipment. The first such box was made of iron sheeting welded together with a glass port inside, and a removable side plate held on by some 25 quarter-inch bolts. It took at least half an hour to set the movie camera in the case and tighten down the nuts. The less said about this first case, the better.

Next I tried a cast aluminum case of two parts, held together by six half-inch bolts. This seems to be a satisfactory answer to the problem. It was quite easily constructed and machined, low in cost and has given excellent results.

A Fascinating Business

Working underwater is a fascinating business. One really moves into a new world to be accepted quite non-chalantly after a preliminary eye-brow-raising by the underwater inhabitants. The colors and color effects are exceptional. I have never seen the coloration of the fishes, and especially the iridescence of their sca'es, reproduced on canvas by any painter or even by color film. Combined with these beautiful colors are the fascinating shapes of the corals and the fishes.

The area in the Bahamas where most of my photographic work has been done has been among the reef heads close to the almost unbroken barrier reef beyond which lies the open ocean. This outer part of the reef is the area where, because of the greater activity of the water, many corals live best and display their most brilliant hues. The massive coral heads and short stretches of coral reef lie behind the main barrier like a loosely fitted jigsaw puzzle. The valley bottoms between the coral heads are covered with white sand, a very necessary part of the underwater photographer's lighting system.

It is within these corridors that one has the most exciting and unforgettable experiences. I sometimes believe

While roaming along the side of coral head, a small school of foot long YELLOW TAILS (Ocyurus chrypurus) became interested in the strange intruder. Every few minutes the school would circle out from their coral cave, take a quick look and wander back again.

A two-foot TRUMPET FISH or PIPE FISH (Aulostomus maculatus) glides slowly by a large branching trunk of ELK HORN coral (Acropora palmata). Usually this odd sea character, a relative of the little sea borse, is seen swimming or resting head downwards among sea plumes.

A large PARROT FISH feeds upon the algal growth found on the surface of the dead coral head. A central head of coral often becomes the host to many types of growth, such as the brown BUSH CORAL, the RED FINGER SPONGE, and the STAG HORN CORAL.

that the fish are quite aware they are being photographed. On one occasion, I recall moving slowly along a rather narrow valley, and before I was able to adjust the camera on its tripod, a n-ixed school of brilliantly colored Rainbow and Blue I arrot glided past, weaving in and out among the over-hanging branches of coral. Being at the end of my 100 feet of air hose, I set up the camera, with a sigh of regret, to take a photograph of one solitary Nassau Grouper which was fanning himself beneath the bare arms of an Elk-horn Coral. Just as I set the camera in motion, the school of Parrot fish condescendingly wove their way back, giving me a perfect action for 20 feet of film.

On another occasion, I maneuvered into a good position to catch the detail of a particularly beautiful jutting ledge of coral. A small Yellow-tail glided back and forth, up to the moment when the camera started rolling, then, as graceful as any ballet dancer, completed a spiral motion around the very end of the ledge I was photographing. Such occasions as these occur with really wonderful regularity.

Then, of course, there is always the tale of the one that got away. In this case, it was not one, but I should judge about two thousand. I was strolling down an incline between two large masses of coral, with the camera and tripod tucked under my arm, looking about for an interesting subject. Suddenly around the corner swept some 2,000 Jack. (This is a small fish about eighteen inches long, shaped like a mackeral or tuna.) They were so closely packed that as they brushed by me, it was impossible to see either of the walls of the valley. I stood helplessly open-mouthed till the last one passed by.

These same fish gave me one of my worst frights, when a small school of fifty or so, suddenly passed, coming swiftly upon me from the rear. This is a world of silence and no horns are honked and no passing signals given, so when fast moving objects dart quickly past you without warning, it gives you a real scare.

Dangers of the Deep

This is not a perfect world, however, and still contains many dangers. Oddly enough, my greatest fear centers around a very lowly and slow moving animal. This is the Black Spiny Sea Urchin. The Urchin, or Sea Egg. as it is sometimes called, belongs to a group of animals known as the Echinoderms. To this same group belong the star fishes and the sea cucumbers. The Sea Urchin's body is slightly oval or round, and up to four or five inches in diameter. From this body with its hard casing, extend long tapered spines; these are sharp, brittle, and often poisonous. I have had the misfortune of having these spines enter my fingers on three occasions. This was sufficient to cause the sweat to break out, due to agonizing pain caused by the poison. It is interesting to note here that the prescribed Bahamian method of getting rid of the pain is to hold the affected part over the flame of a match until the pain from the burning becomes worse than the pain from the poison. It seems to work. From this description you can readily understand my fear that some day I will become too preoccupied with the framing and taking of a particular scene and forgetfully back up into the rugged coral wall upon which these Sea Urchins often cling. Memory of the spines themselves, which are five or six inches in length, adds to the happy thought.

Some of the corals are distinctly poisonous and produce a stinging sensation. A small piece of coral, on one occasion, broke off from a piece that I was collecting high up on a coral head, and wafted down, touching my shoulder on the way. It left a welt, like the burn of a red hot poker. On another, rather embarrassing occasion, I found that one of the long twig-like stinging corals had somehow poked its way up the pant leg of the khaki shorts I was wearing. Each attempt to jump upward only resulted in my floating down again into the same unfortunate position. I walked like a cowboy for a week.

The Barracuda

As far as the fish themselves are concerned, there are only a few of which one must be wary. It is just a wee bit disconcerting to be intently photographing an underwater scene and then suddenly realize that a very healthy looking four-foot Barracuda is circling about you at a distance of three to five feet. Somehow you do not mind too much when you are able to watch him out of the corner of your eye as he circles in front, but when he disappears behind you, your heart searches for space within your throat. It is impossible to spend much time underwater without philosophying to some degree. I found, for example, that there is a difference between knowledge and faith. When a long silvery fish with a protruding, undershot jaw, well supplied with teeth comes into view, you know that it is a Barracuda. When he circles behind you, you recall that you have heard that Barracuda never attack unless an object flashes with sudden movement. Then you cross your fingers and have faith in that knowledge. A favorite trick of the Barracuda is to stand off eight or ten feet from you, opening and closing its immense mouth. The mouth is so large, in fact, that the body of the animal entirely disappears, and only an oval of teeth, with the gullet in the center, flanked by the inside gill slits, is visible. One's imagination plays tricks, and you would swear that you can distinctly hear the clang of those teeth as they viciously come together.

During all of my diving experience there was only one occasion when a Barracuda actually made menacing passes at me. This time, two of us were diving and taking pictures. I had just finished taking a scene of the other diver climbing up the drop line into the boat, when I noticed a Barracuda at his heels. Somehow the animal sensed my desire to follow the same pathway and poised itself in the usual Barracuda manner, head-end slightly lowered, right at the end of the drop line. Any movement on my part immediately caused the fish to dash with amazing speed toward me, passing within two feet, to circle and go back to his station. On each occasion I crouched and kept the metal camera case as a rather inadequate shield between us. The use of shark repellent powder, which was lowered to me from the dinghy standing watch over me, was almost disastrous, as it was in a white bag and the shaking of the bag only excited the Barracuda more. Finally, I signalled for a spear gun, with its fourfoot quarter-inch projectile of stainless steel. Letting the camera case float to the surface as the Barracuda swept toward me, I took a step forward and shot the spear into its head. Unfortunately, I missed the area of the spine which would have stunned it. Instead, the spear imbedded itself just behind the eye in the hard cartilage. The lashing of the Barracuda bent the steel spear into a complete U, and after making one swing toward me, he dashed off toward the open sea. I was missing one spear, but without regrets.

My strongest desire last year was to enter into another area of the underwater world which I had visited on only one other occasion. This was the 50-foot depth. My

reasons for taking underwater pictures is because of their great value in presenting the underwater world to biology students, as well as to the public at large. It is also an area of research for my own interest and information. The 50-foot depth opens up a possibility for contrast between the animals and plants which live in the shallow and rather unsettled depth of 15 feet, and the rather serene 50-foot depth. Here, larger and different types of fish are found.

It was during the taking of one scene at the greater depth, that a fish weighing about 50 pounds persisted in coming toward me every time I raised the camera. Through the camera finder I would see him come gliding toward me to finally disappear beneath my range of vision. I just had to look down. His nose, six inches from my bare midriff gave me a very squeamish sensation. I could not scare him away. Even striking at him with the camera case had no effect on his equanimity. It seemed impossible to make him go away. After a while, and only when he was positive that he had investigated all my diving equipment, he lazily turned away, and at that point, I believe I took my first breath in several minutes.

With fifty feet of water above you, creating on the surface of your body a pressure of 19 tons, and with the boat some 150 feet away and completely out of sight, you feel very much alone. It is, however, an aloneness that is completely fascinating. Large sultry mounds of rounded coral rise up from the smooth sand. Odd, powerfully built, and beautiful fish, swim about while the smooth waves overhead act like huge lenses to focus the sun's rays which play upon the bottom like a thousand search lights. There is so much to see and to photograph. The distance haze created by the water atmosphere curtains off one's vision at a distance of a little more than 100 feet. In and out this haze come and go the creatures of the deep. Never two scenes alike in this ever-changing world of beauty and fascination.

Johnny Appleseed's Correspondence

DEAR JOHNNY:

I wonder if either you or your associates have done any work with p-aminodiamethylaniline monohydrochloride as the SOLE developing agent for black-and-white films—and with morpholine as the SOLE alkali in a developing solution intended for black-and-white negative development?

If so, in each case, what was their effect on the grain structure, the definition and general negative quality?

If you are not in a position to answer these questions, can you suggest literature where same may be consulted?

G. N. GARRISON

1)EAR MR. GARRISON:

Yes, I have experimented with p-aminodimethylaniline monohydrochloride as the developing agent for black-and-white films. Compared with popular fine-grain developer formulas using p-phenylenediamene, this compound gives more graininess and equal speed losses.

Morpholine, when added to a developer like D-23, increases the development rate and the graininess.

JOHNNY APPLESEED, APSA

EXPLORATION AND DISCOVERY WITH THE COLOR CAMERA

A PSA COLOR DIVISION FEATURE

BY

HOWARD DEARSTYNE

Over the course of the last decade color photography has been for me both a means of recreation and, increasingly, a source of understanding of the visual aspects of nature and of the world of form generally. However simple and readily grasped certain things may, with experience, come to seem, these things are not necessarily so when one is first confronted with them. One arrives only slowly at an understanding of those profound truths which eventually appear so simple in the realm of the things of the spirit generally, and, specifically, in the world of visual art. One's eyes become fully opened to the potential beauties of nature only after years of seeing and seeking, but once they are opened they can convey to us unending "visions of pure delight."

HOWARD DEARSTYNE, Palace Green, Williamsburg, Virginia, is a registered architect and member of the A.I.A. He graduated trom Columbia College, studied two years in the Columbia School of Architecture and then went to Germany to continue his studies, remaining there for the six years from 1928–1934. He studied four years at the Bauhaus, Dessau, Germany, and received the diploma of this school, being the only American to hold it. He thereafter continued his architectural studies in Berlin with Prof. Ludwig Mies van der Rohe, working with him for two years. (Mies van der Rohe is now head of the Department of Architecture of the Illinois Institute of Technology in Chicago.)

He returned to America and worked as an architectural designer for Harrison and Fouilhoux, Radio City architects, for four years and also for other firms. He subsequently taught for about nine months at Black Mountain College, one and a half years at Lawrence College, Appleton, Wirconsin, where he was also resident architect and at the Cranbrook Academy of Art, where he was in charge of the Department of Design for two years. Since 1946 he has worked in the Architectural Records Department of Colonial Williamsburg. Inc., and has taught architectural design at the College of William and Mary.

. He started taking photographs in the usual way, with a Brownie, as a boy. At the Bauhaus, where he came in contact with first rate artists and photographers, he began to take photography seriously and started his search for form in that medium which has continued to this day. He began his color work around 1940 and has worked almost exclusively in color ever since. He states he has no prejudice against black and white photography but finds the possibilities in color richer and more varied.

He uses a Leica camera which he bought in Berlin in 1934. His alides have been widely exhibited and a number were included by the Museum of Modern Art in its show, "New Photographers."

PAW PAW, THE SNOW-FOOTED (1945). The pressure of the dog's feet compacted the snow enough to preserve this record of his passing after the surrounding snow had melted. The dog. therefore, helped to create these footprints in relief.

The world is an inexhaustible, ever-changing reservoir of visual experiences. It does not, of course, actually change fundamentally but we do, and with our change and development the world, in effect, also changes for the reason that we come to view it differently.

One of the first things I found out in the course of taking pictures was that photographic compositions, like those in painting, must be exact or reasonably exact to give aesthetic satisfaction. The accidental, that is, that which fails to serve as a functioning part of an ordered pictorial whole, has no place in the photograph. There are no readily-determinable and conveniently-applicable rules of composition, yet every photograph must be composed or ordered in some one of an infinite number of possible ways if it is to be considered a work of art. I knew this and so I set out to make well-composed color pictures with the camera.

I soon found it expedient, in order to eliminate superfluous or incongruous elements from the picture, to isolate the particular tree branch, flower or what-not in which I was interested against a simple natural background, such as the sky, or snow, or water, or sand. The simple background enabled me better to control the forms which entered the composition and the background also contributed to the whole its color and texture and frequently certain shapes such as clouds in the sky, ripples in the water, etc.

In photographing objects against the water of a pond or lake I became aware of additional pictorial possibilities which resided in the mirror action of the water. The dark bottom of any pool, as is well enough known, makes the pool a fluid mirror in which the reflected images of clouds, trees and other objects are continually being altered or distorted. I discovered that this distortion of their images frequently rendered commonplace forms fresh

and exciting. So, I took pictures some of which were composed wholly of the distorted reflected images of objects while others were a combination of reflections and actual objects, such as things floating in the water or adjacent to it.

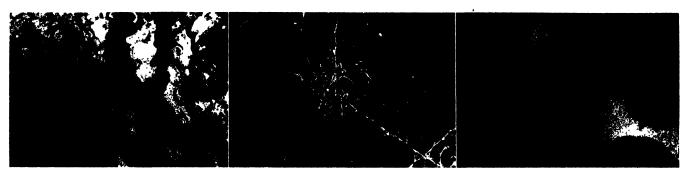

It may be well at this point to speak of reflections in general. No reflector, not even a good mirror, gives an exact reproduction of the object reflected, and most, for one reason or another, distort it more or less radically. This distortion consists in a veiling of reality which lends an intriguing sense of remoteness or mystery to a picture.

As for backgrounds, I gradually came to see that any simple natural or man-made surface could serve this purpose and that, furthermore, objects themselves can form their own background, as in the case of a composition made up, let us say, of leaves and grass, footprints in the mud, etc. And concerning subject matter I learned that anything whatsoever can constitute the raw material out of which a picture is made. There are, I discovered, no hierarchies of value in subject matter which make a beautiful girl, for instance, a potentially better -ubject than an old shoe or a batch of leaves on a wet pavement. What always counts most is the effectiveness of the composition of form, color and light which is achieved with the

being wrought in the things within it by natural forces the alterations which are brought about in growing things from one season to another and the changes caused in the appearance of objects by rain, snow, wind and, above all, by lighting.

Light is a primary determinant of both the quality of the color in a picture and of its mood. As to the latter—a composition made up of any group of objects can be gay or gloomy, matter-of-fact or mysterious, rich or barren, by turns, as a result of the varying character of the light which falls upon it. Light, the source of the photograph, is also one of the chief resources of the creative photographer.

Color photography poses its particular problems and possesses special potentialities which do not exist in black and white photography. The color transparency, once it is made, cannot be altered or, at least, should not be, whereas the black and white photographer can do much to enhance the quality of the print he makes from a negative by manipulation in the darkroom. The possibilities in color photography, on the other hand, are much richer and more varied. Color, of course, is one of the chief elements in composition and many a configuration of objects which in a black and white photograph would

INKY UNDULATIONS (1945) Left. A perfect mirror, presumably, would reflect a perfect image, that is, an exact copy of the object. A liquid mirror, which is far from perfect, when set in motion by the wind, transforms the image of an object or group of objects into an ever-changing series of strange and frequently grotesque forms. CREEPING CRABGRASS (1950) Center. There is something arresting about an inanimate object, like a stone, which suggests something living; in a plant which

has something animal-like about it, and in either when it takes on some human aspect. This is pictorial poetry and it is, in a general way, equivalent to literary devices such as metaphor, simile, the parable, etc. ABSTRACTION ON CONCRETE (1945) Right. The dictionary defines "abstraction" as the concentration of attention on some one aspect of an object to the exclusion of all others. Here the identity of the subject matter is cloaked so that we are aware only of its form.

subject or subjects employed. Each subject, of course, impresses its particular personality upon the picture and makes it unique over against all other pictures. But the fact that both a good and satisfying photograph and a bad and unsatisfactory one can be made of either the beautiful lady or the old shoe suggests that factors other than subject matter determine to a large extent the aesthetic quality of the result.

From this it follows that one need not journey to some distant photographic happy hunting ground to find suitable and satisfying subject matter. There is as much potential beauty at one's doorstep as in the grandiose Rockies or in exotic Tahiti. If one searches this beauty out, he will find that the small fragment of the world which lies within easy reach of his hearthstone is a rich storehouse of pictorial compositions which is ever replenished by changes in form and color which are constantly

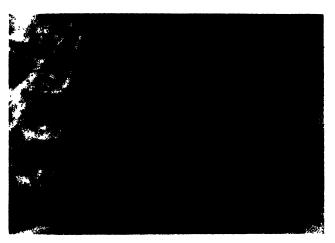

lack sufficient interest becomes exciting and satisfying when recorded in color. Light, again, plays a vital role here. It has the power of altering both form and color so drastically as to justify our asserting that, in respect to our perception of these, there is no such thing in nature as a constant form or a stable color.

It has been my experience that bright sunlight, far from augmenting color, definitely fades or weakens it. I make many of my pictures in the early morning or toward evening when sunlight takes on a mellow, rosy hue which lends warmth and richness to the picture. I make many color shots in the shade or partial shade where the subject is illuminated by reflected light, which is much less harsh than the direct rays of the sun, and many, also, on cloudy days or in the rain where the colors of things are saturated and most satisfying. I have discovered that the only disadvantage of rain is the discomfort it visits on the

photographer—it is certainly kind to the color picture. A word of caution should be given here concerning the use of strong contrasts of sunlight and shadow—these are very difficult to handle successfully in color photography.

One further important characteristic of color photographs should be noted—their ability to portray the third dimension. Color pictures give a far greater impression of depth than black and white, because, probably, they approach reality more closely—our world is, after all, a colored world. The photographer, however, must make judicious use of this advantage. The photograph, to rise above the realm of decoration must, indeed, create the illusion of the third dimension, yet the depth represented should be a limited one. I judge this from the fact that the best of my pictures are invariably restrained in their three dimensionality.

Photographs, I now know, are most successful when they are precise in detail—soft focus, impressionistic effects are a natural province of painting, not photography. The virtues peculiar to each technique must be exploited to their fullest to produce with each the best result. The camera is capable of achieving an exactness

SANDPIPER'S MUD LARK (1950). This is scarcely an abstraction. The perambulating bird is still very much present in its tracks. The thing or things called to mind by the forms, the mental image evoked, though less definite than the actual image, is an integral part of the experience we have in viewing a picture such as this.

of recording which the painter can never hope to obtain. The ability of the photograph to present the full reality of objects in the world roundabout is one of its outstanding merits for, when the photographer chooses significant combinations of objects, colors and lighting, this reality can be surpassingly beautiful.

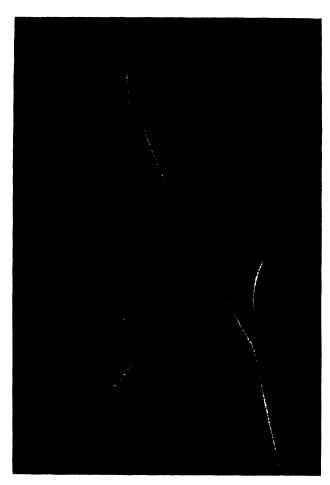

It is remarkable what framing a potential picture in the viewfinder of the camera does to the objects thus framed. First of all, it segregates these objects from their surroundings and enables the operator of the instrument to choose with far greater certainty those arrangements of forms, colors and light which will produce satisfying pictures. This enframement concentrates the attention upon a relatively few objects so that the photographer sees them fully, perhaps, for the first time. Furthermore, cut off from their surroundings as they are by the viewfinder,

STRINGY-HAIRED MOPPETS (1951). This picture depends upon suggestion for its chief interest, rather than on form. There is a feeling of something grotesquely human in the mopheads which gives them a whimsicality which a pair of actual human figures would not have.

SHADOW OF THE THIRD WHEEL (1946). In a picture light and shadow forms mingle on a more or less equal footing with real objects—all are the potential raw materials of pictorial compositions. An actual object, such as this tricycle, will generally dominate over the forms created by light since the object has three-dimensional solidity and greater detail, while light forms and shadows are two-dimensional and flat.

STAYED SUSPENSION (1950). The interest in this picture resides primarily in a sense of physical forces at work in it. The snapping of the stem, first of all, is still recalled in it. Then, we can readily imagine the broken stem, blown back and forth by the breeze, inscribing the series of arcs on the soft tarpaper background. Finally, the grass head hangs downward like a weight suspended from a crane (the diagonal part of the stem) and a guy (the shadow) stays or supports the latter.

these objects cease to be so much parts of the actual world as dynamic and living entities in a distinct and self-sufficient new world—the world of the picture. The taking of the photograph thereafter serves only to record the picture which the photographer has already singled out.

In the selection of the materials of the composition the manner in which the objects are "cut off" is most important both to the composition and to the affective power of these objects. Things which as wholes are not arresting frequently become so when some well-chosen part only is included within the bounds of the picture. Furthermore, an object normally vertical, like a building or a tree, often takes on added interest in the picture when it is inclined, so that I very frequently tilt the camera in taking a picture.

It is most instructive, in training the viewfinder on first one and then another group of objects, to observe the divergent character of the pictures which are thus isolated. All phases of art seem here represented, from realism and impressionism through expressionism, surrealism, abstraction, etc. Nature sometime, somewhere produces combinations of forms and colors akin to all of those found in the most radically modern paintings-a fact which, were it generally known, would tend to silence the absurd. unceasing disputes concerning the validity of one or another of the various forms of modern art. If surrealist forms, abstractions, etc. abound in nature, how is it possible to object to them in painting on the ground that they are unnatural and illegitimate? It is manifestly impossible to place the stigma of falseness and corruption on Dame Nature, the mother of all things, animate and inanimate, and the ultimate source of all pictorial ideas and ideals. At any rate, the so-called eye of the camera is an impartial, unprejudiced eye and sees at every turn things which to many seem shocking or ridiculous the moment they appear upon the canvas. The camera, indeed, can be a powerful agent in the emancipation of the vision and can unlock many of the secret doors of art.

The Stereoscopic Art-Part 4*

J. A. NORLING, APSA

GENERAL DATA

For successful stereoscopic projection, it is important to know the size to which the picture is to be projected, for upon this knowledge depends comfortable viewing or maximum effectiveness, or both. Distortion of the subject for the spectator depends on his viewing distance and the angle at which he views the picture, but as in conventional movies, distortion due to the spectators viewpoint is not serious unless he is very far off screen center or extremely close to or very far away from the screen.

Stereoscopic Terms

There are certain terms used in stereoscopy. These are:

The Stereoscopic Window

The "frame" behind which the scene apparently exists in space. In some cases, elements of the scene may extend in front of the window. These are special effects, and do not belong in a discussion of basic principles. The symbol is Sw.

Interocular (In)

The distance apart of the human eyes. We may select 2.5" as the interocular.

Interaxial (I)

The distance apart, or horizontal spacing of the stereo

^{*} Concluded from page 25, January 1952 PSA JOURNAL.

camera lenses, more truly the spacing apart of the central axes of the picture area.

Major Distance (D)

The distance from the lenses to the farthest object.

. Minor Distance (d)

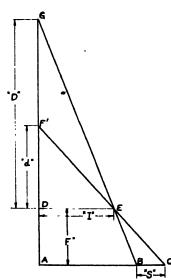

The distance from the lenses to the closest object. This is often the plane at which the stereoscopic window is planned to exist. In most cases, the nearest object will be a slight distance in back of the nearest plane.

Width of Image (w)

Refers to the width of that part of the negative which is to be used in the final prints. For standard 35mm theatrical film, this is .825", for 16mm—.4", for Stereo-Realist slides—.875".

Focal Distance (F)

Refers to the distance from the principal node of the lens to the film, and does not refer to the equivalent focal length of the lens, although in most cases the stated focal length may be considered the focal distance. It is only for extreme close-ups that a differentiation must be made.

The geometry of the stereoscopic process.

Parallax Index (P)

This refers to the parallactic difference between disparate members of the stereoscopic pair when projected. The parallactic difference is determined by the following factors:

- 1. The distance to the nearest plane in the subject.
- 2. The distance to the farthest plane in the subject.
- The ratio between image width and focal distance of the lenses used.
- 4. The interaxial used.

Parallax index can be expressed by the equation

$$I = \frac{W}{PF} \times \frac{Dd}{D-d}$$

This equation was derived from the accompanying diagram, which represents the geometry of the system of taking stereoscopic photographs. Calculations are simplified if we consider one of the lenses collinear with the far and near points.

Points D and E represent the positions of the two lenses: The distance DE is the interaxial "I". Distance

DA or EA is the lens to film distance, and its symbol is "F". F and G are points on the nearest and farthest planes in the subject. DF is "d" and DG is "D". BC is the horizontal shift on the image plane created by points F and G, and this distance has the symbol "S".

It will be seen that if the nearest point is superposed on the screen that the farthest point will be separated by an amount determined by the interaxial used in taking the picture. The maximum value of the distance of homologous points on the screen should not exceed $2\frac{1}{2}$ inches to avoid visual discomfort. To the observer, homologous points back of the stereoscopic window which are $2\frac{1}{2}$ " apart should appear to be at virtual infinity. Some individuals can tolerate $3\frac{1}{2}$ to 4 inches, but it is best not to use "super infinity" if it can be avoided. Homologous points that superpose on the screen will seem to lie in the plane of the stereoscopic window.

The minimum distance at which observers can look at a picture comfortably when it has a 2½" maximum separation of points is about six feet. In general, the maximum horizontal displacement should not exceed 1/30 of the viewing distance. This requirement exists because in viewing projected stereo pictures, the observer must "uncouple" the facilities of convergence and accommodation of the eyes.

In viewing, it is desirable that the parallax index be 24 or greater.

Parallax index P may be stated as

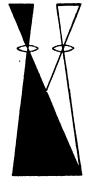

$$P = \frac{D_v}{I_n}$$

where D, is the viewing distance, and I_n is 2.5".

Thus where $D_v = 60''$, P = 24; where $D_v = 120''$, P = 48, etc.

General Rules

1. A general rule can be laid down for the photography and projection of stereoscopic views: The projected view should have the same angular dimension for the viewer as

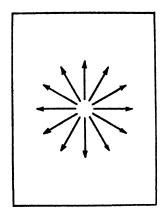

The principle of lens angle and viewing angle.

the scene taken by the camera. This is the ideal, but never attainable in practice except for just one person at the prescribed distance from the screen and viewing the screen along the projection axis.

2. The apparent depth of the stereoscopic view should be the same as the real depth of the scene. To attain the right apparent depth, the correct interaxial must be employed. The required interaxial varies over a wide range and for projected views must be given much more serious consideration than for hand-held views. If we plan to

Representation of a cluster of light vibrations.

project on an 18 foot wide screen, we must not use as wide an interaxial as we can use on a six foot screen, because if we do, and employ convergence to establish the stereoscopic window, we are either going to have homologous points at infinity spread so far apart that the eyes have to diverge to accommodate for them, or we are going to have to adjust the projected stereoscopic window to a plane far in front of the screen.

It is not difficult to arrive at the correct interocular if we use the simple equation

I (interaxial) =
$$\frac{\text{we d}}{\text{sf}}$$

where w = width of the image on the film,

e = normal human interocular (21/2")

d == distance from the camera lens to a plane just in front of the nearest object (plane of convergence),

s = width of the projected picture,

f = focal length of the camera lenses.

The establishment of the stereoscopic window is not of great importance in hand-held views, but it must be employed in projection, and properly employed. If it is not, there will be the marginal disturbances that have been mentioned before, and they are hard to look at. There is nothing in natural vision to correspond to them, and since the ideal stereoscopic view is one that should afford complete visual comfort, the appropriate window frame should be calculated in every scene. If it is not, people may have trouble looking at your stereoscopic "master-pieces."

Very striking stunt shots can be made stereoscopically. For instance, objects can be made seemingly to float in space between screen and observer provided the object is well inside the margins of the picture areas. Objects should not be photographed so as to appear so near to the person observing the projected images that he will have trouble fusing them. Consideration must be given to the accommodation limits of the eyes; that is, for convergence accommodation limits.

Theoretical accommodation limits of the human eye in convergence are based on normal close reading distance of 15 inches. (Note: This formula does not take into consideration what physiological effect, if any, is introduced when the accommodation muscles are used without correlative focusing.) The angle of convergence of the eyes (interpupilary distance of 2.625 is used) at a distance of 16½" is slightly more than 9°. The displace-

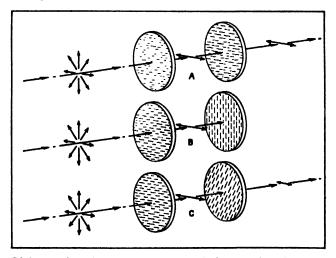

ment of the disparate images on the screen are given in inches and decimals of an inch.

Formula: Observer distance from screen less 15" multiplied by the tangent of half the angle subtended by the eyes gives the maximum separation on the screen at a given distance. To obtain the required separation of images on the film, divide the projection aperture width by the screen width and multiply by the separation of the projected images. (tan 4°30' x distance from the screen)

An Analysis of Light Polarization

Since the phenomenon of light polarization is so closely related to the practice of stereoscopy, it is of benefit briefly to review it.

Light passing through two plane polarizers: A-with axes parallel, B-with axes at 90° to each other, C-with axes at less than 90°.

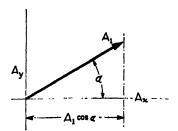

Let us imagine we are looking head-on at a beam of light and that we can conceive it as a bundle of rapidly vibrating arrows pointing outward in an infinite number of directions. A polarizing filter can cause all vibrations to take place parallel to each other.

The polarizer transmits not only the vibrations which are originally parallel to the polarization axis, but all the components of all the infinite number of vibrations at angles to the axis. The amplitude of any vibration along the axis is equal to

A₁ cosa

where a is the angle between the direction of vibration and the axis.

Since the energy of a vibration is proportional to the square of its amplitude, the relative intensity I_u of light

Vector diagram of a vibration.

transmitted by two polarizers with axes at any angle from 0° to 90° is given by

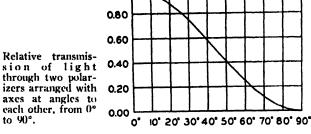

$$I_u = I_o COS^2 \alpha$$

when the angle between the polarizing axis is a and I_0 is the relative intensity of the transmitted light when the angle a is zero.

A graphical representation of this, with I_o arbitrarily equal to unity, shows the relative intensity of the light through two polarizers with axes at various angles to each other. This curve is true only for perfect polarizers which would have a transmission of 50%. Actually, the best polarizers have a transmission of only about 40%.

Conclusion

The fundamental requirement of any stereoscopic

1.00

system is that each eye sees only that member of the stereoscopic pair intended for it and excludes the image belonging to the other eye. The disparate images of the stereoscopic pair must be distributed to the eyes of the audience in a selective manner. To quote from Dr. H. E.

There are only two places where the distribution of images to cyes can be done; these are at the screen and at the eyes. The number of images at the screen can be reduced to two, if the number of viewing instruments is equal to the number of spectators. The number of viewing instruments can be reduced to zero if the number of images at the screen is made infinite. Any gain in simplification at one point is offset by increase in the complexity or expense at the other.

Camera Club Manual

H. J. JOHNSON, FPSA

Continuing with the revision of the Manual, the second chapter brings a sample constitution which, though it can be used successfully "as is" by many clubs, is intended chiefly as a framework which may be adapted to the particular requirements of any club.

There are two important points in connection with club constitutions: (1) they are not absolutely necessary; (2) their chief value is to fix dates, duties, etc., rather than to prevent politics. Club politicians never let constitutions hinder them unduly.

Chapter II

Camera Club Constitution and By-Laws

The constitution and by-laws of the camera club comprise the formal ground rules by which the officers of the club guide its operations. They serve as reference documents to be followed in spirit rather than observed by exact letter. Their greater use is less for discussion than as the final recourse in cases of doubt or controversy.

No one example of constitution and by-laws can be satisfactory for all clubs. The samples which follow may be regarded merely as patterns found satisfactory by club experience. They may be adapted to the needs of individual organizations.

The democratic principles by which every camera club

should conduct its affairs demand that provision be made for amending the constitution and by-laws as established circumstances dictate, and in answer to the requests of the members. Under ordinary conditions, however, such amendments will not be frequent. Club officers must distinguish between cases of actual need and those sometimes disputatious and arbitrary efforts to effect change for its own sake. On the other hand, the constitution and by-laws should not be permitted to handicap the progress of the club.

CONSTITUTION AND BY-LAWS OF THE CAMERA CLUB

Article I

NAME

Article II

OBJECTIVES

The objectives of this club shall be:

- 1. Association for the mutual enjoyment of photography.
- Encouraging the advancement of members in the knowledge and practice of the science and art of photography.
- 3. Making mutual contributions to the progress of photography.

Article III

MEMBERSHIP

Any person active or interested in the practice of photography may make application for membership in this club as provided in the By-Laws.

Article IV

OFFICERS

Section 1. The officers of this club shall be a President, a Vice President, a Secretary, and a Treasurer whose duties shall be those customarily pertaining to their respective offices.

Section 2. The executive body of this club for the general guidance of its operations and the transaction of official business, subject to the approval of the membership, shall be an Executive Committee.

Section 3. No officer or committee chairman shall serve more than two consecutive terms of office.

Article V

VACANCIES

Section 1. If the office of President temporarily shall for any reason become vacant, the duties shall be assumed by the Vice President.

Section 2. If any office other than that of President temporarily shall become vacant, it shall be filled by appointment by the President, but for no longer than the remainder of his term.

Article VI

MEETINGS

Section 1. Regular meetings of the club shall be held at such times and in such places as may be decided by the Executive Committee.

Section 2. Special meetings of the club may be called at any time by the President, or by the President upon written request of not less than members, or by the Executive Committee.

Note: Many clubs prefer more frequent business meetings, open to all members. So far as possible, these should be held separately from regular program meetings.

Article VII

AMENDMENTS

Section 1. This Constitution may be amended at any Annual Meeting of the club upon affirmative vote of two-thirds of the members, provided (1) notice of intentions to amend the Constitution and (2) notice of the nature and purpose of proposed amendments shall have been given to members at least one month in advance.

Section 2. The By-Laws may be amended, adopted, or revoked, in any manner not in conflict with the provisions of the Constitution, by an affirmative vote of a majority of the members of the club at any regular meeting, provided notice of (1) intentions to amend, adopt, or revoke and (2) notice of the nature and purpose of proposed action shall have been given to members at least one month in advance.

Article VIII

QUORUM

Section 1. A quorum of the membership at any regular meeting shall consist of not less than one-quarter of the members.

Section 2. A quorum of the membership at any Annual Meeting shall consist of not less than one-third of the members.

Section 3. A quorum of the Executive Committee at any meeting

for the transaction of official business shall consist of not less than one-half of the Committee's membership.

Article IX

FISCAL YEAR

The Fiscal Year of the club may be any appropriate period of 12 months selected by the Executive Committee.

Note: The most frequent period is that fitted to the camera club "season", in which the greatest activity is Sept.-June.

Article X

APPROVAL OF CONSTITUTION AND BY-LAWS

This Constitution and these By-Laws shall be regarded as officially adopted upon their approval by a vote of not less than two-thirds of the total members in good standing.

BY-LAWS

Article I

NOMINATION, ELECTION, AND INSTALLATION OF OFFICERS

Section 1. Officers shall be elected by majority vote of members present at the Annual Meeting and using official written ballots provided by the Secretary.

Section 2. Candidates for office shall be selected by a Nominating Committee appointed by the President at least two meetings in advance of the Annual Meeting.

Section 3. The Nominating Committee shall consist of
members of the club who are neither officers nor candidates for office.

Section 4. The Nominating Committee shall prepare a full slate of candidates for offices at a special committee meeting which shall be held separately from any regular or special meeting of the club or Executive Committee and which is attended by no officer of the club.

Section 5. The Nominating Committee shall report its slate of candidates to the club at least one meeting in advance of the Annual Meeting.

Section 6. Ballots prepared by the Secretary shall be distributed, collected, and tabulated at the Annual Meeting by a Tabulating Committee of three appointed from the membership of the club by the President.

Section 7. No member of the Tabulating Committee shall be an officer of the club or a candidate for office.

Section 8. Results of the balloting shall be announced by the chairman of the Tabulating Committee as soon as tabulation is completed and not later than the close of the Annual Meeting.

Section 9. Newly-elected officers shall be installed at the Annual Meeting and shall assume the duties of their respective offices at the close of the Annual Meeting.

Note: Most clubs provide also for petition or floor nominations, requiring that previous agreement of the nominees be obtained.

Article II

DUTIES OF OFFICERS

Section 1. The President shall preside at all meetings of the club and of the Executive Committee; shall appoint the chairman of all Standing Committees; shall appoint the chairman and members of all Special Committees; shall, when properly authorized by club or Executive Committee, sign all written contracts or obligations of the club; shall function as ex-officio member of all committees; shall officially represent the club at meetings of other organizations; shall make a report at the Annual Meeting of the progress of the club under his administration, with recommendations for the coming year; and shall carry on the duties of his

office in such a way as to promote the effective operation of the club.

Section 2. The Vice-President shall perform the duties of the office of President during the absence of the President or during a vacancy in that office; shall be a member of the Executive Committee; and shall perform such other duties as the club may direct.

Section 3. The Secretary shall be a member of the Executive Committee; shall keep the minutes of meetings of the club and of the Executive Committee; shall keep and be custodian of the records of the club; shall conduct the club's correspondence; and shall perform such other duties as the club may direct.

Section 4. The Treasurer shall act as custodian of all club funds; shall render bills for dues and acknowledge their receipt; shall, in cooperation with the secretary, provide members with official membership cards; shall pay bills as directed by the President or Executive Committee; shall keep club funds in a bank approved by the Executive Committee; shall keep an account of all receipts and expenditures; shall make a semi-annual written report to the club of the condition of the treasury; and shall perform such other duties as the club may direct.

Section 5. Additionally, the Treasurer, with two other members of the Executive Committee appointed by the President, shall constitute a Budget Committee which shall prepare an annual budget for the club and shall submit it to the Executive Committee in advance of the first meeting of the year. The budget shall be submitted by the Treasurer to the members at the first meeting of the year and, upon approval by the members, shall serve as a financial measure of the club activities during the year.

Article III

COMMITTEES

Section 1. The President shall, in advance of the first meeting of the year, appoint the chairmen of the following Standing Committees, who shall be members of the Executive Committee:

Membership and Reception Committee Exhibition and Contest Committee Program and Activities Committee

House Committee

Publication Committee

Section 2. The members of Standing Committees shall be selected by their respective chairmen.

Section 3. The President shall appoint such Special Committees as needs may require.

Article IV

DUTIES AND FUNCTIONS OF COMMITTEES

Section 1. It shall be the duty and function of the Executive Committee to carry on the routine business and to guide the activities of the club in such a way as to relieve members of such responsibilities and so far as possible to eliminate the necessity for transacting business at meetings other than those specified for that purpose.

Section 2. The Executive Committee, through the President, shall keep the membership informed of the club's financial status, business affairs, and other undertakings, and shall welcome expressions of opinion by the membership.

Section 3. The Executive Committee shall meet, or at the call of the President, or at the request of any three members.

Section 4. The Membership and Reception Committee shall promote the membership growth of the club, shall welcome guests at meetings, shall act upon applications for memberships, and shall perform such related duties as may be necessary.

Section 5. The Exhibition and Contest Committee shall conduct such print, slide, movie, and other contests within the club as the Executive Committee may direct, shall encourage and facilitate the participation of club members in photographic exhibitions, shall direct all club exhibitions, and otherwise shall promote club activities.

Section 6. The Program and Activities Committee shall, with the approval of the Executive Committee, develop such programs for meetings and other activities as satisfy the needs and pleasures of cirab members.

Section 7. The House Committee shall have charge and custody of all property of the club, shall make all arrangements and preparations for meetings, and shall perform such other duties as the Executive Committee may direct.

Section 8. The Publications Committee shall direct the preparation and distribution of all club publications as instructed by the Executive Committee.

Section 9. Each Standing Committee may, with the approval of the Executive Committee, establish such sub-committees as may be necessary to carry on related activities.

Article V

MEMBERSHIP

Section 1. Any person interested or active in photography may make application for membership in the club.

Section 2. Official membership application blanks shall be provided by the Membership and Reception Committee.

Section 3. Applications for membership, made out in full and accompanied by deposit of an amount equivalent to one year's dues, shall be received and acted upon by the Membership and Reception Committee.

Section 4. Applicants for membership shall be notified by the Secretary of their acceptance or rejection. In case of rejection, the Secretary shall return the financial deposit accompanying the application.

Section 5. Applicants for membership who are rejected may appeal in writing to the Executive Committee, decision of which shall be final.

Section 6. Requirements for membership, classes of membership, dues, initiation fees, and other costs of membership shall be established each year by the Executive Committee, subject to approval by club membership.

Section 7. No member may resign or be removed from the membership rolls unless and until club property in his possession is returned.

Section 8. Members who shall be in arrears two months in payment of dues shall be notified by the Secretary, and, unless payment is made within one month, shall be notified of the cancellation of membership.

Section 9. Any member whose membership has been cancelled for cause shall make application for new membership as provided in these By-laws.

Section 10. Termination of membership shall operate to relieve all right, interest, or title of any member to property, assets, and privileges of the club.

Article VI

TERMS OF OFFICE

Section 1. Officers of the club shall hold office only for one year, unless re-elected.

Section 2. Terms of office of chairmen of committees and of those appointed by the President shall expire with the term of office of the President.

Article VII

APPEALS

Any member of the club who may find cause for dissatisfaction with its operations may appeal in writing to the Executive Committee. The Executive Committee's decision shall be final.

Article VIII

EXHIBITION

Section 1. The club shall hold each year, at the discretion and direction of the Executive Committee, a competitive or invitational exhibition.

Section 2. This exhibition shall be conducted by the Exhibition and Contest Committee.

Section 3. This exhibition if competitive, shall be conducted in accordance with the regulations, and recommendations of the Photographic Society of America.

Article 1X

AFFILIATION WITH OTHER ORGANIZATIONS

Section 1. This club shall be affiliated with the Photographic Society of America, and the Treasurer, without further authoritative instructions, is authorized to obtain and to maintain such membership, paying all required dues and fees.

Section 2. This club may become affiliated with any other organization active in the field of photography upon majority vote of the membership.

Article X

DEFINITION

Section 1. The term "member," as used in the Constitution and By-laws of this club, is interpreted to mean member in good standing.

Section 2. The term "officer," as used in the Constitution and By-laws of this club is interpreted to mean a person elected to office.

Section 3. The term "chairman," as used in the Constitution and By-laws of this club is interpreted to mean a person appointed to office by the President as chairman of a Standing or Special Committee.

Article XI

ORDER OF BUSINESS

Section 1. The order of business for regular and special meetings of the club shall be as prepared or directed by the President.

Section 2. The order of business for the Annual Meeting shall be as follows:

- 1. Reading of minutes of prior Annual Meeting.
- 2. Reports of:
 - a. President
 - b. Treasurer
 - c. Chairmen of Standing Committees
 - d. Chairmen of Special Committees
- 3. Transaction of routine business
- 4. Report of Nominating Committee
- 5. Nominations from floor
- 6. Closing of nominations
- 7. Distribution of ballots
- 8. Voting
- 9. New business
- 10. Report of Tabulating Committee
- 11. Installation of new officers.

Article XII

CONDUCT OF MEETINGS

Conduct of all meetings shall be governed by Cushing's "Manual" or by Roberts' "Rules of Order" insofar as they are applicable to and consistent with provisions of the club's Constitution and By-Laws.

Local Conditions Govern . . .

The newly-organized, or even the established camera club, may find many provisions of this sample camera club constitution and by-laws unsuited to its type of organization, objectives, operations, or circumstances. In such cases the suggested provisions may be altered to suit local conditions.

Some camera clubs have many more officers than herein indicated. In some cases, the chairmen of standing committees are vice presidents. In other cases, provision is made for plural vice presidents to permit of wider representation of club membership in the governing group.

However the club prepares these official rules, it will be found that club activities proceed more smoothly and successfully when placed in direct charge of an elective governing board, such as an Executive Committee or Board of Directors, than when matters are left to vote of the membership at open meetings. Action upon business at meetings other than specified business meetings consumes considerable time, seldom reflects considered action, and constantly burdens club members with routine business which necessarily detracts from enjoyment of club meeting programs and of photography.

Some clubs have additional Standing and Special Committees. The necessary number of such committees is governed largely by the extent of the club's activities. Usually, it is more satisfactory to assign responsibility for each major activity to a different committee so that the chairmen may select as members of the committee those members of the club who, through personal interest or experience, best can promote the activity. This method of organizing also permits more members of the club to be members of committees, an objective which assures an active, healthy club, wide sharing of responsibilities, and good training for future club officers.

Democratic Organization . . .

The average club will find that the ideal situation is that which permits club management to have the widest latitude of control under constitution and by-laws, encourages the broadest possible member participation in committee work and other responsible club activities, keeps all members fully informed of the club's affairs, and assures effective and efficient direction without causing any real or fancied suspicion of rule by dictatorship or rule by clique.

Every club frequently is tempted to keep in office those officers who render outstanding service and demonstrate administrative talent, but two terms in office, the limit provided by the sample constitution, should give the club the full benefit of administrative talents and represent all the time for club affairs which a member reasonably may be expected to give.

Clubs frequently will find it the desire of their members to elect to office those who may possess outstanding talents for photography, but whose administrative capacity is inadequate. This problem is one which each club must solve in its own way. Generally speaking, it may be said that so far as club welfare is concerned, successful administration of the club's business is paramount to success in producing photographs.

No club will find that its constitution, by-laws, or management will be entirely satisfactory to all members. Every club is likely to have some members who are chronically dissatisfied or inherently disputatious, yet who, while critical of the conduct of others, have only limited abilities of their own. This problem in human relations may be handled with as much patience and diplomacy as possible. It is likely to be a persistent headache resisting all attempts at cure or correction, and customarily ends only with the resignation of the protesting member. Isolated cases of this type are normal and reflect no failure of club management. On the other hand, wholesale member dissatisfaction may be accepted as certain indication of conditions requiring immediate correction.

(To Be Continued)

It is fun to make pictures of the baby, Aunt Agatha and Cousin Clarence. For some it's fun to see our pictures hung in the exhibitions. But many Chicago photographers are finding satisfaction in recording current scenes on photographic paper for the benefit of future generations, as well as for others in this generation who may not be as observant of our present ways of life.

Under a project sponsored by the Chicago Area Camera Clubs Association, more than 1,000 prints have been added to the permanent files of the Chicago Historical Society in the past two years by members of the clubs. These pictures are for the use of writers and authors, now and 100 years from now, with credit given to the photographer and to the Society. The prints are also being used for exhibition purposes.

Recognition and Awards

Besides the satisfaction of using our hobby to contribute to an institution of civic importance, there are interesting material awards for those who participate in the Historical Project. Each year the photographer who has had the most acceptances receives a trophy. Another goes to the camera club whose members have had the greatest number of acceptances. When any photographer

herochery

8x10 prints of any of some 200 negatives he shot at the 1933-34 Chicago World's Fair. Fifty were requested.

Currently photographed scenes that have been added to the archives include among other buildings, residences, churches, hospitals, schools, theatres, stations, banks, bridges and libraries. Here again there are two general classes. There are the old homes and public buildings dating back two or more generations and which are rapidly

has had five prints accepted for the archives, he receives a Certificate of Recognition from the Trustees of the Chicago Historical Society. When 25 accepted prints have been contributed, a medallion is awarded; and, when the 75 mark has been passed, a specially engraved plaque is given together with a membership card in the Chicago Historical Society.

Subjects Covered

Most of the pictures contributed are of scenes photographed currently. However, a number of contributions have been from negatives that were made years ago. For instance, J. Sherwin Murphy, of Jackson Park Camera Club, has a file of negatives exposed before World War I, a number showing airplanes and other items of that era. D. Ward Pease, FPSA, of Fort Dearborn, offered to make

Outline of a project of community service that can be undertaken by any club or council being destroyed; then there are those that are typical of present day architecture.

Typical interiors of homes, offices, schools and factories are especially desired. And Chicago has some slum areas too which are included in the collection.

Aerial photographs, shot from planes or high buildings are always good when sharp. Thus the photographer becomes a map-maker of present day layouts.

Activities of all kinds are acceptable: parades, celebrations, sports, expositions and typical street scenes. Equinemounted police in Chicago went out only a few years ago, but some of our local photographers had good negatives of them. Pictures of people at play, at work, and going about their business are especially needed. Remember how styles in everyday clothes as well as bathing suits are changing! Some farm scenes have been sent in but not enough. Farm equipment changes almost as fast as bathing suits, as does also methods of transportation, automobiles, street cars, streamliners and planes.

Mr. Paul M. Angle, Director of the Chicago Historical Society, has suggested that "we keep in mind the desirability of recording for future generations pictures of how this generation lives." That indeed is the goal of our Historical Project.

The Chicago Area Camera Clubs Association has clubs

^{*} Chairman of the Chicago Project for Historical Photography.

JUDGING THE PRINTS --- HISTORICAL PROJECT Mildred Mead, Jackson Park Camera Club, Chicago Historical Society File.

in its membership from lower Wisconsin and upper Indiana. The Historical Society's interests go just as far. All clubs in the Association can participate by entering pictures taken locally. The Gary (Indiana) Photographic Society has entered a large number of photographs made in that city. It happens that the Gary club has a "Face of Our City" project of its own, which ties in well with the CACCA Historical Project.

And we do not forget that camera club activities are interesting and important in the present generation. The Historical Society's file has a number of pictures of field trips, studio nights and such.

Mechanics of Handling the Project

Publicity concerning the Historical Project is sent to the 60 clubs in the area at intervals. It consists of material for bulletin boards and for club publications. The CACCA News is supplied with copy for every issue, reminders of forthcoming deadlines, and reports of recent judgings. R. L. (Bob) McIntyre, Camera Editor of the Chicago Tribune, has given the Project much helpful publicity.

For the permanent files prints are required to be 8x10s, glossy, and either doubleweight or singleweight mounted on cloth or paper. The photographer is instructed to take particular pains in washing the prints, otherwise discoloration will take place in time. Also neither rubber cement nor glue can be used in labeling and mounting as these cause discoloration. Mounting tissue is okay; so is library paste. Each print must carry the data as to the subject, its location and the time the picture was taken. While it is easier to determine the value of the print if it is submitted in permanent form, photographers are encouraged to bring in prints of any size and character, with the understanding that if the picture is judged to have historical value, the maker will prepare a print in the required form for the permanent file.

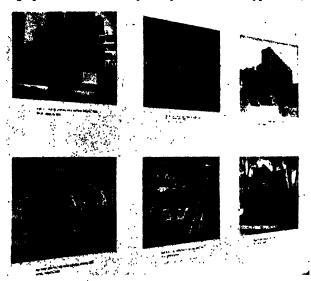

Three dates during the year are set as deadlines for receiving prints for judging, usually in November, February and April. The prints are examined by Mr. Angle,

Director of the Historical Society; generally he invites an official from one of the local book companies to sit in. Besides, there are present two or more members of the camera clubs who advise principally as to print quality and as to whether the photographer might be able to make a more acceptable print from his negative.

Rejected prints are returned to the maker with information as to reason for rejection, sometimes with the suggestion that a desirable picture of the same subject could be made from a different angle.

Exhibition of Prints

The Chicago Historical Society at its building on North Avenue, from time to time devotes a room to hanging of selected prints from the collection. Thus Chicago people learn about the Chicago Area Camera Clubs Association and one of its current projects. Also local photographers who have not participated have an opportunity

DISPLAY OF PRINTS — HISTORICAL PROJECT A group of prints on display at the last exhibition at the Chicago Historical Society.

to see the kind of pictures considered important from the historical point of view.

In connection with the opening of the last exhibition of selected prints, the Chicago Historical Society had a tea (of sandwiches and coffee) especially for participants, with other photographers invited. At that time the entire file of prints was brought into the room for inspection. The file, however, is available for inspection by anyone at any time by application to the Curator.

Project Appeals to All

Proficiency in pictorial print making is not required for turning out important pictures of documentary or historic value. Choice of subject matter is of first consideration. And the photographer does not need to go far from his home to find it. Good ordinary darkroom practices will turn out prints that can reproduce well in publications. Here the photographer exercises his hobby straightforwardly—no paper negatives, no toning, no worry as to whether the center of interest is properly located. Here "record shots" not acceptable to a salon

jury may become "documentary" and the pictures of preference.

Local-scene photography becomes a fascinating study once started. The photographer is inspired to observe what is going on in his community, and to find out how some everyday things came into being. Then there is the challenge to find the best way to make a factual and understandable record on photographic paper.

Accomplishments

The Chicago Project for Historical Photography was slow in getting under way. Each year more interest has

BELGIAN VILLAGE, WORLDS FAIR CHICAGO 1933 D. Ward Pease, FPSA, Ft. Dearborn Camera Club, Chicago Historical Society File.

MOUTH OF THE CHICAGO RIVER Dr. Frank E. Rice, Ft. Dearborn Camera Club, Chicago Historical Society File.

been shown than the year before. In the photographic year 1950-51 more prints were submitted and more accepted than in all the earlier years combined. Awards to individuals having 75 or more prints accepted were made for the first time: Mr. and Mrs. Al Bloom, Mildred Mead, J. Sherwin Murphy, all of Jackson Park Camera Club; Tedward A. Dumetz, Jr., Lens Camera Club; Dr. Frank E. Rice, Fort Dearborn Camera Club.

Mildred Mead received the trophy for the largest number of acceptances during the year—131. Jackson Park Camera Club was the trophy-winning camera club with 364 prints. In the past two years, more than 1,800 prints have been submitted in the Project, of which 1,084 were accepted.

Mr. Angle, Historical Society Director, recently wrote: "This morning I took stock of the prints submitted as the result of our last judging. They confirmed my conviction that in the historical photography project, we are engaged in an undertaking for which those who follow us will never cease to be grateful. I cannot tell you how much I appreciate what you have done to make it the success it has become."

The Kodak Colorama*

W. H. DeWitt †

The IDEA behind the Kodak Colorama in Grand Central Terminal can be traced back to the New York World's Fair of 1939 and 1940. The Kodak Hall of Color at the Fair demonstrated color photography on a huge scale for the first time, and response to the exhibit was so great that Kodak advertising and sales executives planned to produce a similar exhibit whenever possible.

* From a talk given before the Rochester Technical Section of the PSA.
† Color Print Processing Department, Eastman Kodak Company, Rochester
4, N. Y.

When World War II was past, the availability of space in the East Balcony of Grand Central brought the decision to produce a great color show of gigantic color photographs. The Development Department at Kodak's Camera Works and Kodak Research Laboratories worked out preliminary methods. Then the job of making the 18 by 60 feet transparencies on a schedule of one every three weeks was assigned to the Color Print Production Department at Kodak Park.

To make a photographic enlargement usually, it is necessary to have at hand a negative, an enlarger, an easel, print stock, some developing or processing tanks, and a means of drying the print. The Colorama is no exception to this rule, but much of the equipment used is unique because of its size. Another feature of special consideration is the fact that the print is made up of strips of film spliced together with a transparent tape. This job in itself is an exacting one for which specialized techniques had to be developed.

The Colorama is produced by printing a Kodak Ektacolor negative on Kodak Ektacolor Print film. This is regular Ektacolor material as supplied to professional users. We may assume here that we have at hand a composite negative approximately 5x15 inches from which it is planned to make a Colorama print. We can then follow through the steps of its production up to and including its display in New York.

The first step is preparation of the negative. Because of the magnification used, it is imperative that the negative be clean. For this reason, and for ease of handling, the negatives are mounted between glass plates. The magnification factor used in Colorama prints has ranged from 44 times to 50 times. At this enlargement, a tiny scratch can appear in a final print as a 1-inch line. Finger prints reproduce as large size contour maps. It is difficult to overemphasize the care necessary in handling these negatives.

The enlarger was specially constructed for this project with an eye to providing rigidity, uniformity of illumination, and accuracy of control of negative positioning. The light source is a 1,000-watt prefocused filament lamp. The objective lens is a 10-inch f/4.5 Kodak Ektar.

It isn't often that surveyors are involved in setting up an enlarger, but to insure perfect perpendicularity between the optical axis of the enlarger and the easel, engineers were called in to determine a base line by standard surveying methods, using a transit. The enlarger moves back and forth on a track bolted to the floor. This is necessary since a small angular error produces considerable image distortion when the enlarger "throw" is 40 to 50 feet as used for most pictures.

Special precautions are used to insure even illumination at the easel. Variations in intensity greater than .01 log E across the width of the easel are corrected prior to the printing of any negative. A new lamp is used for each picture. All lamps are pre-aged to reduce possible variation in intensity during the exposure of a picture.

The easel is 19½ inches by 20 feet, with light-tight boxes, to hold the film, located at each end. A form of shutter is provided by the light-tight covers which can be raised or lowered by a pulley arrangement. To ensure that the film is flat during exposure, a vacuum manifold is used. A vernier device mounted at the right of the easel is used in conjunction with an indexing scale mounted along one edge of the negative to determine correct positioning of the negative for each strip. A small overlap in printing permits perfect registration between strips.

Film, supplied on spools in 220-foot lengths, is loaded into the supply box at the left. It is then threaded through edge guides on the easel board into the take-up box on the right.

Test prints are made contact size with a small printing frame at the easel. The enlarger, pre-set for the magnification to be used in the final print, is used as a light source. This eliminates conversion factors otherwise

necessary. An average exposure time is approximately 1½ minutes.

In making the final print, the practice is to position the negative properly for each strip with the easel shutters closed, open the shutters, expose the strip, advance the film, close the shutters, position the negative for the next strip, and so forth.

The processing machine is a Kodacolor Paper Processor modified as necessary for Ektacolor Print solutions. Processing time for an entire picture is approximately 6 hours with the film traveling through the machine at a speed of 3.0 feet per minute. All solutions are carefully controlled to avoid "start to finish" variations in speed or color during the processing of a print.

After processing, the film is removed from the end of the machine in a wet condition in rolls 19 feet long representing the individual strips of the picture. The strips are festooned on wooden frames for drying.

Two special tables were constructed for registering and splicing Colorama prints.

The splicing table is about 4 feet wide by 20 feet long. A steel insert forms a cutting edge down the center of the table top, and a steel straight edge along one side of the table is used to position guide bars for the cutting tool. This same straight edge also acts as a guide for the tape applicator. The table top is also fitted with a vacuum manifold similar to that used on the easel.

The viewing table is used for color checking, registration and retouching. 3500° white fluorescent lamps illuminate the 4x20-foot viewer surface.

After slitting, the strips are registered on the large viewer and a temporary cellulose tape seam is applied to the emulsion side. This is done to assure perfect registration when the permanent splice is made. The registered strips are then returned to the splicing table for application of the Kodapak tape which forms the permanent splice. The tape applicator carries a roll of tape and a small hopper of cement. The splice is formed by applying a bead of cement to the base side of the film immediately preceding the point of contact with the tape.

The steps just outlined are repeated as necessary to complete the picture.

The cellulose tape is generally left in place for a few hours to prevent any leakage of cement through to the emulsion side of the film.

As the strips are assembled, the film is wound onto a large spool. Glass fabric tape is applied as an edge binding and grommets are inserted to provide a means of supporting the picture for display.

Spiral-wound paper tubes form the body of the giant film spool. These spools weigh 220 pounds while the Colorama film itself weighs approximately 75 pounds.

Before shipment to Grand Central, each completed plcture is viewed in an area in the Kodak Park Recreational Building. One-half inch cables anchored in the ceiling there support a diffusing screen and the print being inspected. Filtered daylight is used for illumination. Since the area used permits viewing the print from distances comparable to the minimum viewing distances in New York, those defects requiring retouching can be detected during this "preview."

For retouching, Flexichrome dyes are applied with a small retouching brush or an air brush. In general,

retouching has been limited to correcting spots caused by dust particles or scratches on the negatives. Distracting highlights are toned down by the use of the air brush.

Reinforced wooden boxes are used for transporting the finished print to New York.

And now let's take a look at the Colorama Display and Photographic Information Center in Grand Central.

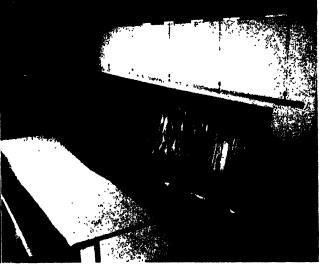

A prime requirement of the installation was that it should fit into the architectural atmosphere of the terminal. Public reaction to the display indicates that this aim has been achieved. As a matter of fact, the Colorama is the inspiration of hundreds of letters written by persons from all parts of the country. Most of these letters contain comments on the pleasant and relaxing sight of a

position—at which point the flat car will have moved into position at the bottom of the lift. The flat car can then be attached to the lift again, making one, vertical, traveling unit.

With the film secured in the vertical position, the business of hanging the picture is relatively simple. Small springs attached to the framework are hooked into the grommets along the top edge and one end of the film. Then the film is unrolled slowly and additional springs are engaged as the traveling unit is moved along the track.

On May 15, 1950, the first Colorama was in place and ready for exhibition. The lights were turned on, the curtains pulled back, and the warm glow of a California garden brightened the first floor of the terminal.

ABOVE: Front view of a Colorama Enlarger. RIGHT: Raising a Colorama print for preview, prior to shipment to New York. BOTTOM: (Left) Hanging completed color picture, 18 by 60 feet in size. (Right) Typical Colorama print as displayed in Grand Central Station, New York City, photographed by J. Wolbarst.

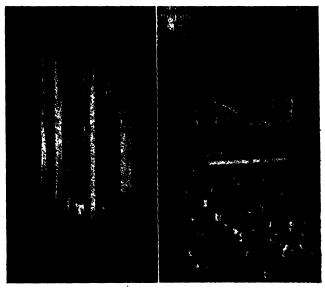

friendly group or colorful garden greeting them as they enter the nation's largest city.

The display and exhibit area occupies the entire east balcony of the terminal. Construction of the permanent steel structure was started early in the Spring of 1950. Here are a few little-known details.

The Colorama is illuminated by a solid bank of cold cathode tubes spaced 2½ inches on centers and totaling 5,328 feet in length. Individual tube lengths are 9 and 11 feet. The tubes operate at 15,000 volts with a total power load of 61,000 watts.

There is a diffuser between the lamp bank and the transparency formed by twelve sheets of opalized methyl methacrylate $5x18\frac{1}{2}$ feet bolted together. Flat white reflector panels are located behind the lamp bank.

An electric extension lift, which together with a detachable flat car rides a special track built at the base of the steel framework, is used to handle the transparencies. The spindle at one end of the 19 foot film spool is fitted into a special bearing plate on the flat car (detached from the electric lift). The spindle at the other end of the film spool is attached to the rising platform or the electric lift. Raising the lift then pulls the spool into a vertical

At the same time, the Kodak Information Center located in back of the Colorama was opened. Here visitors have an opportunity to see exhibitions of fine photography and equipment. A staff of technical representatives is on hand to answer questions on photographic topics.

The pioneering effort of the Eastman Kodak Company in producing the Colorama has created a whole new concept of advertising through giant color photographs.

PICTURE OF THE MONTH

A NEW ACTIVITY FOR EVERY PSÄ MEMBER

JOHN R. HOGAN, HON. PSA, FPSA

W

IIILE YOU are reading this the January
Picture of the Month has been completed
and all entrants have received their Certificates of Award or their prints, discussions,
complete scores, and other things that
make this activity interesting. Don't wait
for the scores to be published in PSA
JOURNAL before you get into the fun yourself, there must be some delay due to
publication deadlines.

Read the complete rules in the January JOURNAL (page 33), and then send your 8x10 unmounted prints to Picture of the Month, The Photographic Society of America, 2005 Walnut Street, Philadelphia 3, Pa. Put your name and address, the title of the picture, the Class in which it is entered, and your Division and Portfolio affiliations on the back. Use a strong envelope in which we can return your prints or other matter and include first class postage.

For February the following Classes are available:

Class 1. Open Pictorial.

No restrictions of any kind except size, and open to every member of PSA. Prints in this Class will not be discussed when they are returned.

Class 2. Advanced Pictorial.

For any member of PSA who makes his own prints and has not hung more than two different pictures in two international, national or state salons. When prints not winning Certificates of Award are returned, they will be discussed by qualified analysts.

Class 3. Beginners Pictorial.

For any member of PSA who made the original exposure, but had negatives or prints made by others, amateur or professional. When prints not winning Certificates of Award are returned, they will be discussed by qualified analysts.

Class 4. Open Portrait.

No restrictions of any kind except size, and open to every member of PSA. Prints in this Class will not be discussed when they are returned.

Class 5. Beginners Portrait.

For any member of PSA who made the original exposure, but had negatives or prints made by others, either amateur or professional. When prints not winning Certificates of Award are returned, they will be discussed by qualified analysts.

Class 6. Advanced Nature.

For any member of PSA who makes his own prints, but has not had prints accepted in any nature salon. When prints not winning Certificates of Award are returned, they will be discussed by qualified analysts. Class 7. Beginners Nature.

For any member of PSA who made the original exposure, but had negatives or prints made by others, either amateur or professional. When prints not winning Certificates of Award are returned, they will be discussed by qualified analysts.

Your attention is called also to the Nature Competitions handled direct by the Nature Division. Nature Division members will receive proper entry forms in due time.

Class 8. Abstractions, Photograms, Unusual Effects.

An Open Class for every member of PSA, no restrictions of any kind except size. Returned prints will not be discussed, but it is hoped the makers will include discussions when they send the pictures to us, so that they can be included when winning prints are mounted in books for the PSA Library.

Class 9. Personal Photography.

For every member of PSA whose pictures reflect his own feeling and thinking about any subject whatever, but who is not interested in "pictorial photography." Maximum size 8x10, unmounted, prints to be made by the entrant.

This Class is under the personal supervision of Jacob Deschin, APSA, who will comment at his own discretion on selected prints, and select the three best for Certificates and publication in PSA JOURNAL. No points will be awarded in this Class, but the winning prints will be mounted in books of their own Class, with the permission of the entrants, and used for the further purposes of the Society.

Come on folks, let's go!

FORE Masaru Taketa

A winner in the previous Print of Month Contest.

OFFICIAL NOTICES

Annual Meetings

The meeting was called to order by President Mulder at 1:25 PM, October 10, 1951, in the Grand Ballroom of the Book-Cadillac Hotel, Detroit, Mich.

Owen K. Taylor spoke in favor of a special Division for stereo. Charles Howe approved the idea and expressed the hope that such a Division would be created. George Johnson pointed out that Color Division already has a stereo program in operation, and was opposed to the establishment of a separate Division for stereo. Dr. Wightman spoke in favor of a separate Division for stereo, emphasizing the high technical nature of stereo, and the fact that stereo is black and white as well as color. Dave Darvas spoke in favor of stereo salons.

"Ollie" Romig told of the establishment of the Byron Chatto Memorial Cornerstone Membership through donations by several of Mr. Chatto's friends.

The General Membership Meeting was adjourned at 1:51 PM, and the National Council Meeting was called to order at 1:54 PM by John Mulder. The following District Representatives, Honorary Representatives, and Board Members were present:

Sten Anderson George Blaha Alfred Blyth Clyde Carlton Angel de Moya Frank Fenner Mrs. Caryl Firth Larry Hanson Charles Heller Herbert Howison Vincent Hunter George Johnson Prescott Kelly Curt Lugg John Mulder P. H. Oelman Harry Reich "Ollie" Romig Hoyt Roush C. C. Ruchhoft William Swann Sandra Thaw Sidney Thomas Doris Martha Weber Paul J. Wolf

John Mulder, reviewing the 1950 meeting of the Society's National Council, reported that the suggestion of Cortland Luce regarding correspondence courses seemed rather complicated and involved too much office help but was still under consideration. Nothing has been done regarding Axel Bahnsen's suggestion that material from the Portfolio Notebooks be used to aid new beginners, but this suggestion is to be acted upon by the new Board.

Walter Pietschmann spoke in favor of Ralph Gray's petite salon.

Retiring President Mulder introduced the incoming officers and Mr. Harkness took the chair.

Mrs. Phelps read the obituary list for the preceding year.

Mr. Harkness discussed plans for the coming year.

Board Meeting

The 12th meeting for the 1950-51 term of the Board of Directors was called to order by the President at 9:55 AM at the Book-Cadillac Hotel, Detroit, Michigan, on October 10, 1951.

The following were present: G. W. Blaha, W. E. Chase, T. Firth, N. Harkness,

PSA JOURNAL, Vol. 18, Feb. 1932

C. Heller, T. T. Holden, H. M. Howison, V. H. Hunter, G. F. Johnson, J. H. Magee, J. W. McFarlane, J. G. Mulder (presiding), P. H. Oelman, H. R. Reich, C. C. Ruchhoft, W. F. Swann, Doris Weber, E. P. Wightman, S. P. Wright (Secretary).

President Mulder invited Owen K. Taylor to the meeting to speak for the Board of Governors of the Stereo Society of America, to request PSA to consider the possibility of setting up a special division for stereo photography, and to organize monthly and annual competitions in stereo. He stated that his organization has developed rules and standards for stereo competition and has published a complete bibliography on stereo.

Mr. Chase favored establishment of a stereo division. George F. Johnson pointed out that CD already has provisions for handling stereo competitions, and there is no reason for a new division to handle stereo. Mr. Taylor said CD judges had demonstrated inability to judge stereo. It was decided that a committee should be appointed by the incoming President to investigate this subject.

The District Representatives were invited to the meeting. The following were present: H. C. Carlton, Prescott V. Kelly, Dr. M. L. Kuhs, Dr. C. J. Marinus, Elbridge G. Newhall, Louis Parker, O. E. Romig, Mrs. Sidney Thomas, Paul J. Wolf.

Mr. Newhall spoke on the desirability of mailing PSA JOURNAL on time. Mr. Harkness replied that this matter is being taken care of and would continue to receive careful attention.

Mr. Kelly asked for more intimate contact between the Society and the Representatives.

There was a general discussion regarding securing lists and other information from Headquarters. Mr. Heller said that Headquarters records were in good shape and that service would be improved. Mr. Harkness congratulated Mr. Heller and Mr. R. Wright on the manner in which business is being handled at Headquarters.

Dr. Kuhs brought up the subject of taking better care of delinquent members.

Mrs. Thomas asked that benefits be arranged for Camera Store Memberships.

Dr. Marinus urged that more Regional Conventions be arranged, to increase contact with members in the small cities.

Mr. Wolf discussed handling of Color shows at recent conventions. In the future CD will supervise these shows.

Miss Weher, in behalf of Aubrey Bodine, asked about the eligibility of prints that have hung in another PSA show. In the discussion which followed, it was agreed that PSA Exhibitions were to be regarded like any other international exhibit, and that moving the exhibit annually was no excuse for resulumission of accepted pictures.

Adjournment was at 12:13 PM, to reconvene at 9:00 AM Thursday, October 11, 1951.

The meeting was resumed at 9:00 AM at the Book-Cadillac Hotel, Detroit, Michigan, on October 11, 1951. The following were present: G. W. Blaha, W. E. Chase, N. Harkness, C. Heller, T. T. Holden, H. M. Howison, V. H. Hunter, G. F. Johnson,

J. H. Magee, J. W. McFarlane, J. G. Mulder (presiding), P. H. Oelman, H. R. Reich, C. C. Ruchhoft, W. F. Swann, Miss Doris Weber.

Mr. Harkness reviewed recent developments in his plans to increase advertising revenue from PSA Journal. He and his partner have sold, without cost to PSA, approximately \$15,000 worth of new advertising and they have been promised an additional \$47,000 worth. He arranged with Mr. Hayden to work with PSA Journal on a temporary basis to develop a program for full-time selling of Journal advertising. The Board authorized Mr Harkness to negotiate month by month agreements with advertising, salesmen Stuart Chambers has agreed to serve as business manager.

Mr. Howison reported continued investigation of the By-Laws in connection with recent Board actions. He presented the following amendments, which were approved by the Board and which will be submitted to the National Council for vote.

ARTICLE III, Section 2—Add the following after the first sentence: "Members whose dues shall remain unpaid thirty (30) days after the anniversary of their admission to membership in this Society, shall be considered as not in good standing."

ARTICLE IV, Section 2-a After the word "Contributing", add the words "Cornerstone Life",

ARTICLE VI, Section 8-After the words "unauthorized expense", delete the balance of the sentence and replace with the words "without the approval of the Board of Directors"

ARTICLE VII, Section 4 - Delete the present Section 4 and replace with the following: "Procedure. At least five (5) months prior to the official election date, the Nominating Committee shall have prepared an official slate of one or more candidates in good standing for each national, sectional or district office. The Nominating Committee shall have obtained acceptance of candidacy, and of office if elected, from each candidate and shall certify the slate of candidates to the Secretary who shall cause such slate of candidates to be published in the official journal of this Society at least three (3) months before the election."

ARTICLE VII, Section 5-Delete the present Section 5 and replace with the following: "Petition Nominations. twenty-five (25) or more members in good standing of this Society may submit to Headquarters a written petition nominating any eligible member for any national elective office. Any twenty-five (25) or more members in good standing of this Society, resident in one of the three geographical sections described in Article IX, Section 2-e of these By-Laws, may submit to Headquarters a written petition nominating any eligible person resident in that geographical section for that section's representative on the Board of Directors. Any ten (10) or more members in good standing of this

PSA CONVENTION

New York, New York, August 12-16, 1952

Society resident in a District, may submit to Headquarters a written petition nominating any eligible person resident in that district for the office of that district's representative to the National Council. All Petitions to be valid must be accompanied by a statement in writing from each candidate declaring his or her willingness to accept office if elected, and shall have been submitted to Headquarters at least fortyfive (45) days in advance of the official election date. Petitions so submitted shall be certified to the Secretary and to the Elections Committee who shall, in turn, cause the names of such candidates to be placed upon the official ballot,"

ARTICLE VII—Insert a new section to be known as Article VII, Section 7 as follows: "Article VII, Section 7. Voting. All members in good standing of this Society shall have the right to vote for all candidates for national elective office, but only those members in good standing of this Society resident in a given geographical section or district, as such geographical sections or districts are described in these By-Laws, shall have the right to vote for representatives of that section or district."

ARTICLE VII---Since the above constitutes a new Section 7, renumber the present sections known as Sections 7, 8, and 9, to read "Sections 8, 9, and 10."

ARTICLE IX, Section 2-e-Delete the present Section 2-e and replace with: "Three (3) members of this Seciety, the first elected to represent members resident in American and Canadian territory lying east of the Official Central Time Zone, the second elected to represent members resident in American and Canadian territory comprising the official Central Time Zone, and the third elected to represent members resident in American and Canadian territory lying west of the Official Central Time Zone."

ARTICLE IX, Section 3.—Delete the first sentence and replace with: "The Board shall hold at least six (6) meetings each year, not more than three (3) months clapsing between meetings."

ARTICLE IX, Section 4—Delete the last sentence of this Section and replace with: "In addition the Board may transact emergency business by mail, telegraph or telephone."

ARTICLE XVIII, Section 4-Delete the first sentence of this Section and replace with "Any member in good standing of this Society may, at any time, submit in writing to the National Council any proposed amendment to this Constitution and these By-Laws".

By mutual consent, it was agreed to table the following proposal. It will be acted upon at a later meeting. This proposal was that Article 9, Section 5 be changed by deleting the word and numeral "five (5)" and substitute the word and numeral "seven (7)".

Mr. Howison commented on his four years of service on the Honors Committee. He has noted several basic changes in thinking with regard to requirements and qualifications for Honors. He suggested that PSA determine and publish critical bases for awarding the various honors. Mr. Oelman's experiences substantiated Mr.

Howison's recommendations. It was their combined feeling that Article XIX of the By-Laws provides for operation of PSA honors in a reverse method of that desirable, since it seems advisable for the Board to establish the broad policies rather than to leave all these matters for the discretion of the Honors Committee. It was unanimously voted to ask the incoming President to appoint a committee with the assigned duty to recommend to the new Board a setup expressing currently the qualifications and requirements for PSA honors, this committee to be composed of former honors committee chairmen and members of general interest.

The Board approved the August 13-16 dates for the 1952 Convention in New York.

The meeting was declared closed at 12:30 PM. J. G. MULDER

STEREO

DON BENNETT

There's good news tonight. Stereo has achieved the status of a PSA Division. Dr. Frank E. Rice, APSA, of Chicago is the Chairman of the new Division. Herbert C. McKay, well-known authority on stereo photography and Director of the Stereo Guild, has agreed to give the benefit of his organizational experience to the new Division.

Creation of this Division should mean much to our members interested in stereo, and it should also step up membership in the PSA. Owen Taylor has already brought in ten new members. Now if you other readers will get busy. . . .

A Stereo Division means more stereo activity within the PSA. If you are even slightly interested in stereo, why not affiliate with the new Division. It costs only an extra dollar and you'll derive far more in benefits than the money you invest. Send your buck to PSA Headquarters in Philadelphia. (If you also invest some time in the Division, you'll reap benefits money can't buy.)

Had a letter from Lee Comegys of Gates Mills, Ohio. He has been enjoying Jack Norlings articles as much as we have. Lee has been having some fun in experimenting with stereo in his own fashion.

His letter says: "As a Leica enthusiast I am having great fun making stereograms and mounting them in Verascope masks for viewing with a Busch viewer. They're wonderful!"

Now there's a stereo fan for you. Sure they're wonderful.

However, Lee has run into a bit of difficulty. He's read several books on the subject of stereo but finds them too technical. Feels a need for some ABC stuff.

Well, now, just how ABC can we get. Perhaps we have an unsuspected fourth reader (Lee makes No. 3) and we should get more to the abc instead of the advanced ABC. Play it safe and assume that

Lee can't even point a Leica straight. Do you mind, Lee?

One of the early attempts to conquer the high cost and radical complications of stereo which came from balanced shutters, matched lenses and transposing, along with transposing printers, viewing boxes, adjustable interaxial controls and a lot more Greek, was the use of a single lens camera with suitable spacing means to provide a pair for stereo viewing.

More recent forms of such simple devices are the sliding base for the Rollei cameras and the parallelogram base for flopping the camera from side to side. Perhaps you have seen these in the literature, or in stores.

Most books on stereo provide the design of a simple, home-made sliding base, usually of wood, but better if made with metal sliding surfaces.

The point of this discussion is that a base of some sort is highly desirable, a firm platform which holds the camera in both positions, properly aligned, and most important of all, level. In fact, a spirit level should be included in any such home-made device. (Don't forget to level the camera mounting plate before fastening the spirit level down!)

Actual spacing between the lens positions can be almost anything you want to make it, IF. That IF is important. Conventional spacing ranges from 65mm down to about 57mm for normal subjects at normal working distances. Aerial surveyors use a base from one to five miles by flying that far between successive shots. If you are working in the micro or macro field, your spacing might be only a few millimeters. So unless you know exactly what you are doing, stick to a spacing that is conventional until you get things under control.

Next point is to have the camera support level in the horizontal direction, the line perpendicular to the direction the camera is pointing. The forward axis can tilt up or down as composition and subject dictate, but that side to side axis must be as flat as if a surveyor laid it out with due allowance for the curvature of the earth!

So you have a level camera and the proper spacing and your exposures are matched. Then what.

Then comes the tricky part. Tricky, if you don't know what goes on. Simple if you use a stereo camera with related mounting service. In this case all you do is write a check. But in Lee's case, it isn't that simple. (There are mounting services which will do unconventional mounting like yours on a time and materials basis, and if you get discouraged we'll gladly supply name and address.) Lee wants to put his films side by side so they look like they were made with two Leicas instead of one.

Let's de-trick his problem. Lee, go to an art store and get yourself a thick piece of acetate sheet, say 1/32nd of an inch thick. Tape it to a piece of glass, say an 8x10 plate or a small sheet of window glass. Now scribe a deep scratch the long way of the acetate sheet, low down. Run some India ink or similar black dirt into the scratch so you can see it. Now you have a base line.

Erect a perpendicular to the base by

scratching another line at exact right angles to it. At your proper viewing separation, which is probably 65mm (measure your Busch masks), scratch another line perpendicular to the base line. (For you guys who have been out of school ten years or more, perpendicular ain't the same as vertical, it means at right angles to!)

You have built a mounting guide.

By placing a film in register on the base line with the vertical line passing through a point at infinity, naturally with the left film on the left line and with the right film on the right line, you have registered your stereo shot in alignment. The base line preserves your horizontal alignment and the vertical lines maintain proper eye spacing.

But what if it is an interior shot and you can't see infinity through the walls? That is a equine of another tint.

Herb McKay makes an adjustible guide for such problems, with the spacing variable for registering an object at a known distance from the camera. This calls for fine workmanship to keep the verticals parallel as you adjust the guide. Another approach is to lightly scribe several lines near one of the verticals at the proper distances tor the range you will normally use.

Spacings may be determined by formula, but since the measurements involved will be very small and errors will be large, make a calibration film outdoors with a prominent infinity target such as a steeple or water tower, and set up near targets at the desired distances. Actually, a lot of this can be done on one film by spacing the targets laterally, aligning the print at infinity and taping to a temporary film support so you can shift the guide for marking the intermediate registration lines. This may sound complicated, but try it and you'll find it is simpler to do than to read about.

Frankly, while such experimenting can be fun for a gadgeteer, we still stick to our thesis that what is pushing stereo to the front right now is the simplicity that the service provided by the manufacturers gives to us at low cost. The finagling and experimenting that Lee Comegys has tackled was a necessary evil for years and retarded the expansion of stereo to the masses. He runs into the additional hazard that unless his stereo slides made by good, but unorthodox, means are mounted to accepted standards, he loses the fun of joining a stereo portfolio, of being able to project his slides at stereo shows and all the rest of it.

One German manufacturer has seen the error of his ways and brought out a new model that conforms to American practice. Fortunately the Busch Verascope, although the film aperture is different, is compatible with the widespread Stereo Realist size. Note that we haven't used the term standard, because there is none, unless it be the outside size, more or less uniform to all of the current crop. But we hear of a new size that will be still smaller! At least we can hope the mounts will be compatible. One thing we are sure of . . . they can't very well change the interocular spacing of the human skull within the corporate life of any firm wanting to set up a new standard for separation!

Pictorial DIGEST Division

Devoted to News of the Pictorial Division of the Photographic Society of America

Broader Horizons for Portraitists

MAURICE H. LOUIS, APSA

The New Year ushered in an effort on the part of Portrait Portfolios to encourage a greater freedom of expression in portraiture. This endeavor is aimed at unshackling photographers from thinking in terms of the static, commercial-type portrait, and substituting in its stead a likeness which gives an insight into the character and emotional qualities of the subject.

To this end, Portrait Portfolio # 15 has been organized and is composed of fifteen members from thirteen states. They are all amateurs who have progressed beyond the elementary stages of technical ability, and who have the common desire to bypass the hackneyed, conventional portrait. This experimental group was selected from volunteers by the writer who is assistant Director of the Portrait Portfolios.

This new portfolio will be under the personal guidance of Miss Gerda Peterich, APSA, who will act as its commentator. Miss Peterich, teacher, lecturer and author, is well-known for her portraits and pho-

tographs of the dance. Formerly head of the Department of Photography at Ohio University, Miss Peterich is now doing research in the history of portraiture at the University of Rochester for her master's degree.

Miss Peterich is a firm believer in expressiveness in photography and has been successful in imparting this to her students. She feels that the successful portrait must possess content as well as meaning. If these are lacking, the photographer will be unable to reveal the subject's true personality. While a good command of technique is necessary, this, along with the photographer's desire for honors and remuneration, must be secondary to creating worthwhile portraits for the sake of good portraiture alone.

The progress of this new portfolio will be watched with great interest, for its success will be the signal for further efforts to pull portraiture out of its present rut. number. If you write to Eldie Christhilf about joining it, he will tell you that it doesn't exist—but it *could* exist—it could be the very portfolio to which you now belong, if you, the other members and your commentator, would each make just a little effort in the right direction.

Do you want to belong to the Golden Rule Portfolio? You already belong to it-if you and the other members like the idea well enough!

You Can't Beat It

At one time or another, and from various angles, tons of material have appeared in these columns dealing with the relationship which exists between portfolio members and their commentators.

At the Convention in Detroit we were amazed all over again at the depth and the warmth of the feeling which exists between these two groups. We talked to a very large number of our fellow portfolioists, and almost without exception each one agreed that he had the best commentator in the business. As a matter of fact, we heard several arguments that became quite highly personal and almost bitter, as various members of different portfolios pointed out the achievements of their particular commentators, and the things that their commentators did that no other commentators did.

On the other hand, we also talked to perhaps a dozen commentators, and it was very amusing to see how fatherly their attitude was regarding the people in their portfolios. Their argument wasn't that they had the best photographers in their portfolios, but they had the hardest working, most ambitious, most eager, most sincere members.

It seems to us that this is exactly as it should be, and it seems to us that this is one of the very finest things about one of PSA's greatest activities: The Pictorial Division's Portfolios.

By and large, PSA is one great big happy family. There is a wide variety of interests, of course, and a lot of healthy rivalry between the Divisions, but when you get back of these things, you find an unswerving loyalty to the Society. This feeling is not exemplified anywhere in PSA more dramatically, it seems to us, than in the father-and-son relationship which exists between our commentators and our portfolioists.

Long may they wave-both of them!

Swiped from John Hogan

Maybe some of you commentators will be interested in this idea—and if you are a member of a portfolio and your commentator doesn't propose something of the sort

MISS EVELYN ROBBINS, Associate Editor

The Golden Rule Portfolio

How would you like to belong to this portfolio? Every member of this portfolio gives complete data on every print he puts into the portfolio. So far, every print has been properly spotted, and was a print made especially for the portfolio—not a print picked from an assortment of old prints, at the last minute.

In all its history, this portfolio has not been held up by any member; it has moved out not later than the fifth day, and very frequently before the fifth day.

Every member of this portfolio gives an honest and carefully considered estimate of every print, and if he has any thoughts which are too lengthy for the comment sheet, he includes them in the notebook. No member, so far, has ever wasted his

space on the comment sheet by saying simply "No comment" or "I agree with what Jack said" or "I don't understand this type of stuff."

The notebook in this portfolio is bulging fat. Every member, every trip, writes freely—and legibly!—and everyone of the 15 members is on a friendly, first-name basis with every other member. Whenever any member of this portfolio is near a town in which another member resides, he tries to drop in on the fellow-member, or at least give him a call.

All the members of this portfolio share it with other portfolioists in their towns, and with non-portfolioists who are interested in photography. An amazing number of new PSA memberships and new portfolioists have come into the fold through this practice.

The commentator has never yet held up the portfolio, and he gives every print serious consideration and a lengthy analysis. If the print is bad, he says so frankly, and tells why. If it is so bad that it is hopeless he says so; if any sort of work will save the print, he explains how to do that work. He is lavish in his praise and appreciation of good prints, and if he thinks they are good enough, he urges the makers to send to the salons. If the prints are good, but not quite good enough, he is most explicit in his instructions as to how the print can be improved.

This portfolio is known far and wide as "The Golden Rule Portfolio." It has no

29 Spring Street, Brockport, New York

himself, you might be moved to suggest it to him!

We have swiped the idea from John Hogan, Dean of Commentators. Recently, John sent one of his negatives on the rounds, and required each member of the portfolio to make a print from it, and send that print directly to the commentator.

As might be imagined, each member saw something different in the negative, cropped his print differently, toned it differently, and keyed it differently. We imagine that the experiment was as interesting to John as it was to each of the members of Portfolio # 19, and it is an idea that we can heartly recommend.

We do not want to commit other commentators to be as generous, but to each member of the portfolio who demonstrated that he had really taken John's teachings to heart, John sent one of his own inimitable salon prints the prize certainly worth working for!

Comments By a Commentator

THOMAS T. FIRTH, APSA

I am not the first to suggest it, but it seems to me it would be better to call those affairs to which we send prints "exhibitions" instead of "salons." The words "salons" and "saloons" are so much alike that sometimes I wonder if there isn't a sort of kinship between the two words. Probably my thinking is colored by the fact that the judges of a salon so often adjourn to a saloon after wrestling with a salon and hearing some of the names that they are called by the unsuccessful exhibitors and all losers.

Those submitting prints are called exhibitors; why not call them "saloners" or better still, "saloners"? They sure need a drink after working so hard to make four good prints, and then getting four big goose eggs.

Another thing I would like to mention is a statement recently made by a member of the Big Brass, to the effect that there should be an artist on every jury. I will heartily agree to that—as soon as I hear that the painters are insisting that a photographer serve on each jury that judges paintings!

AN INVITATION

This is an invitation to every PSA member to participate in the PSA American Portfolios.

Enrollments are now being received in the following specialized groups:

PSA Pictorial Portfolios

PSA Portrait Portfolios

PSA Miniature Portfolios PSA Control Process Portfolios

PSA Control Process Portfolios
PSA Star Exhibitor Portfolios

(For PSA Award of Merit Winners)

PSA Nature Portfolios

PSA Photo-Journalism Portfolios

For information concerning any of the foregoing activities and for enrollment blanks, write to the Director of the PSA American Portfolios, Eldridge R. Christhilf, Hon. PSA, APSA, Suite 406, 800 Davis Street, Evanston, Illinois.

Recently I read an article in one of the photographic magazines from the other side of the Atlantic, in which the author discussed artists and photographers, and what each stood for, in the opinion of this writer. He pointed out that the work of the artist and of the photographer are so different that both fall down when they try to imitate each other. It was his opinion that when the photographer tries to imitate the art forms of other artists, the photographer reflects an inferiority complex which he should not have because photography has its own vital part to play in modern life. It was his opinion that we must separate art from photographic vision; that while the two overlap a little, they do not actually cover the same ground. The whole purpose of photographic vision is to record and to reveal facts and objects, and so long as photography does these things it will be one of the most valuable visual activities of mankind.

That is what the gentlemen from across the waters had to say, and I think he expressed himself very well. I have no inferiority complex about my form of art, and I make no apologies to the artists. Let them do as they wish, and let photographers do as they wish and let each judge his own exhibitions.

In the portfolios, we all refer constantly to "salon prints" and I think it is quite possible that by doing so we scare away a good many prospective members. Those of us who are interested in salon exhibition, and particularly those who are interested in hanging up records as salon exhibitors, laventirely too much stress upon the importance of the so called salons. It is a big and almost fatal mistake to assume that everyone who is interested in photography is interested in salon prints.

I think that the greater majority of photographers have no desire to make prints for anything except their own satisfaction. They want to make pictures, and they want to make good pictures, and they may even want to make big pictures, but they want to do these things simply to satisfy themselves, their family, and their friends. These photographers don't get the break they should in PSA, in the JOURNAL, and in the portfolios. At least, that's the way I look at it.

We have to be careful about being too formal and austere, for if we are we will scare away the snapshooter who wants to be one of us, and who wants to profit from the information we have and can share with him. These are rambling thoughts, and not quite the sort of thing that has appeared in the "COMMENTS OF A COMMENTATOR" in the past. They are my thoughts as a commentator, however, and they are honest thoughts, worth thinking about.

Maybe it would be a good idea to have a portfolio for people who are not interested in salons and never will be interested in the salons but who just want to make better snapshots. If we get up such a portfolio, maybe it would be a good idea to fine each member \$10.00 for each time he mentions the word salon in the notebook or on a criticism sheet. Boy, what a portfolio that would be!

PSA JOURNAL, Vol. 18, Feb. 1952

COL. C. J. "JOE" PERRY, Associate Editor

"East is East and West is West, and n'er the twain shall meet" may have been the order of the day when Kipling was a smooth faced lad, but then again that was before the advent of PSA and PD's International Portfolios. Today East meets West and West entertains East right in the front parlor where they can park their elbows on Aunt Suzie's what-not! Our many friends around the world is evidence of the fact that there's nothing mysterious in how the other half of the world lives. Standing on common ground in a mutual hobby and banded together in a portfolio of their own choosing, our friends of every corner of the earth become just one group of mighty fine folks earnestly endeavoring to improve themselves, and each other, in their common avocation.

Under the joint supervision of Ed Palmer of Iowa and Manual Ampudia of Mexico, the Mexican-American Portfolio has taken an added spurt and we now have the second circuit making its rounds in that portfolio.

Is there a Swede in the house? There are vacancies in the Swedish-American Portfolio at the present time. We believe that our friends in the Old Country can be influenced to start another circuit there too, if enough stateside Swedes are interested.

On the other side of the world our friends in the Camera Pictorialists of Ahmedabad, India, held their First International Pictorial Photographic Exhibition in November and December and awarded silver and bronze plaques as well as certificates of merit for both monochrome and color. They also held their second annual general meeting last October and elected Surendrabhai M. Parekh as President for the ensuing Surendrabhai is supported by Chandulal J. Shah, Vice President, Dhruva C. Engineer, APSA, Secretary, and T. F. Geti as Joint Secretary. Datta B. Khopker, C. B. Patel and D. U. Mehte constitute the Governing Body. In addition to his many duties at home in the interests of pictorial photography, Dhruva Coomar Engineer finds time to handle the duties of General Secretary for the India-American Portfolio on the India side, and, together with Pon E. Haasch of Boise, Idaho, the American General Secretary, is guaranteeing that the India-American Portfolio is not only in capable and competent hands but one of the portfolios that is winning its place in the sun.

What do you mean 'N'er the twain shall Meet'? Kipling just never heard of PSA and the International Portfolios, that's all.

PSA International Portfolios

There are openings in the following PSA International Portfolios for Pictorial Division members who are interest d in interchanging prints for comment and analysis with the leading photographers in foreign countries:

Anglo-American Canadian-American India-American Australasian-American Cuban-American French-American Swedish-American South African-American Brazilian-American Belgian-American Chinese-American Netherlands-American Dominican-American International Medical Portfolios Costa Rican-American Carribbean-American Mexican-American International Control Process Portfolios

For information, write to the Director of PSA International Portfolios, Col. Charles J. Perry, 7431 Ryan Road, El Paso, Texas.

GFORGE GREEN, Associate Editor

Helpful Photo Hints

Ah, you bashful photographers! Hiding your know-how under a darkcloth. Don't you know that this Helpful Photo Hints is your column? You tell me about shortcuts or new methods or embryonal ideas that will help all us PSAers and I'll pass it along through our PI) section. Surprise me, huh? Deluge me with hints!

Dr. R. W. Beede, 65 East Midlothian Blvd., Youngstown 5, Ohio, passes along this hypo eliminator.

A 0.025% of sodium hypochlorite is rapid, inexpensive and effective for complete removal of hypo. Merely add one teaspoon of fairly fresh Clorox to one quart of water and mix thoroughly.

Dr. Beede washes his prints in water for five minutes after fixation. They are then given two consecutive baths of five minutes each in the Clorox solution. This is followed by a final five minutes washing in water.

I may as well throw one in for luck.

For those who process their own color film, it is advisable to purchase at least six rolls of color film with the same emulsion numbers. Run the first roll through; entering all pertinent data in a reference book. You will then be able to determine the

necessary adjustments (lens, shutter, illumination sources) for the entire batch.

Experience With a Moral

Recently, on a cold and dismal night, I drove more than 30 miles to a camera club meeting where I was scheduled to speak. During my hour's drive (I lost my way three times) I tried to put into everyday language the technical and dry indigestibleness of the reciprocity effect of color films especially when exposed with high speed flash sources.

To shorten a long story, suffice it to state that I finally Americanized it to the point where even a beginner could understand what I meant. And, thus I entered the meeting place.

My first surprise was the turnout. Despite the weather there were more than 40 people representing both sexes from high school to grandparent. On exhibit was a travelling print show from the New England CC Council. The meeting was called to order and each person received a sheet of paper. They then entered their selections for the five places in the show. My second surprise was that the members, practically as one unit, had preferred landscapes for the first four honors with a portrait of a child as the fifth choice.

We'll skip the color slide competition which, incidentally, was excellent not only from the number of slides entered but also for the interpretation of subject matter, and also my talk and subsequent question and answer period, and come to the "meat" of this article.

My closing words harped back upon selectivity and perspectivity—training the eyes to see what you imagine you are looking at and making the exposure in that manner which will produce what your mind saw.

Gosh, that's so simple it isn't even worth spending any time on it. I've said it so you might just as well, too. But, now that you've done so, stop and think. How many times have you raised the camera and pressed the shutter release without giving the subject matter another glance other than the first one which prompted you to take the picture? Once? Twice? Or have they been so numerous that you cannot truthfully determine? And, shall I point a finger at your results? Just answer this: What is your acceptable print percentage compared to the number of exposures? That's all brother!

But, let me get back to the subject. I hammered and yammered about training one's mind to actually analyze what the eyes were seeing. It's an obvious fact that we take the line of least resistance and whatever pleases us at first glance is sufficient. This was proven by the almost unanimous choice of landscapes in the print show.

And, at the members' insistence, I analyzed the show for them with the result that only two out of the five chosen originally remained in my final selection. It was pointed out that there is just as much danger in including too much as there is in omitting just a trifle. There cannot be any fast rule except that one must look first, analyze secondly, and see thirdly.

I do not hold entirely with those who claim that what is on the negative is immaterial because the camerist can achieve the end result by darkroom processes. It is easier to crop something in a negative than to resort to double printing. It is just as simple to try to obtain a compositionally perfect negative at the time of exposure as it is to spend many hours in the darkroom trying to obtain what you first saw.

And even the perfect negative does not make the perfect print. The negative is like a model, without any make-up. Only by training and experience (knowing what to do and how to do it for the achievement of different moods and results) can the model be made to look like what you want. Like make-up, the darkroom worker has at his command the various tools and accessories by which he can improve upon the negative.

Yes, you, too, have probably spent a great deal of time in the darkroom, wasting paper and chemicals and fraying your patience and temper. Yes, you, too, have probably resolved that photography has lost its appeal and as far as you were concerned it could be given back to the birds. No competition was worth the harrowing demands of producing a competitive print!

Maybe you're right. And, again, most likely you're wrong? Anything worth doing should be done right. Why don't you refer to last month's note in the News of the Pictorial Division and check the rules for securing the Personalized Print Analysis Service. I'm certain that the director of this service will be more than happy to help you along the highway to better photography. Just follow the rules outlined.

Award of Mcrit

Those who have become Star Exhibitors since our last listing, and those who have advanced in their Star Exhibitor Ratings are as follows:

New One Star Exhibitors
Louis P. Ganucheau, New Orleans, La.
Walter F. Wood, Montreal, Que., Canada
Dr. Esteban A. de Varona, APSA, San Jose,
Costa Rica
Charles B. Buker, Birmingham, Mich.
Advanced from One to Two Star
William J. Spicer, Cincinnati, Ohio
Barton King, Niagara Falls, N. Y.
E. Throop Geer, M.D., Riverside, Conn.
Advanced from Two to Three Star
Karl F. Kunkel, New York, N. Y.
New Four Star
Merrill W. Tilden, Chicago, Ill.

Bread without jam is like a date without somewhere to go. It's only half the pleasure. The same is true with your prints. Winning Club competitions and salons is only half the thrill. Flatter your ego and glow inwardly by becoming a Star Exhibitor.

Somehow or other there was an error made in reporting the requirements for the different Star Exhibitor ratings listed in the October JOURNAL. The requirements for the various degrees of this award are:

One Star: 6 different prts. -- 30 total acceptances
Two Star: 16 different prts. -- 80 total acceptances
Three Star: 32 different prts. -- 160 total acceptances
Four Star: 64 different prts. -- 320 total acceptances
Five Star: 128 different prts. -- 40 total acceptances

These awards are retroactive and are available to all Pictorial Division members who submit proof of their accomplishments. Send to Glenn E. Dahlby, Director of the Award of Merit, for further particulars. His address is in the masthcad on the second page of this section. Lay that PSA JOURNAL down and do it now! Even a postcard will suffice.

A. LYNNE PASCHALL, Associate Editor

Wake Up Your Club

A letter came into our hands recently from a man who is making an earnest effort to improve conditions in his camera club. The club is a very substantial one and rates high in its territory, but it is plagued by the same troubles that afflict us all. He says in part:

Our club conducts a monthly competition in black-and-white salon prints. Through a point system the winner is given a trophy at the end of the year.

We find that as the year progresses and two or three persons outdistance others in accumulating points, the rest seem to lose interest and take the attitude of "What's the use to enter prints, we can't win." Consequently, fewer prints are entered and the competition lacks enthusiasm . . .

Also even at the beginning of the year, we don't have as many prints entered each month as should be expected in a club of approximately sixty members . . .

Doesn't this remind you of conditions within your own club? Of course it does! It is exactly what happens in every club, large or small. One or two energetic members get ahead of the rank and file and thus create a gap that seems to grow wider with time. The standing of the club in the community depends largely upon these brilliant members, so we dare not lose them.

On the other hand, there are some ambitious souls who hope to reach the top some day but are progressing very slowly. They are perhaps the most important group because once in a while one of them brings in a picture. It may not be a prize-winner but it is an honest effort to cooperate. Such members are easily discouraged and must be handled with tact and understanding, for they are the future hope of the club.

Below this classification is often an army of "chair warmers" who have joined because they think it is the smart thing to do. Some of them own high-priced cameras but never make prints and are very irregular in attendance. Should they be crowded out? By all means, No! Just keep them coming, because after all, print makers do need an unbiased and appreciative audience.

One way of encouraging full attendance is to have interesting programs to supplement the print-making activities, not at every meeting perhaps, but often enough to keep up the interest of the whole group. And right here is where PSA comes in. The program material that we continually advertise in these columns is supplied to member clubs without profit and for the sole purpose of helping out when other interests lag. It is one of the many services the Pictorial Division provides.

You can have a talk by one of the country's celebrated photographers via tape recording, and that's something! Other activities are:

American Exhibits

In October, Fred Fix told me that all his exhibition-print shows were booked up until February, but by this time some of them may be available again. Write him for his latest list and tell him what dates you have open. Perhaps there will be something for you. For example, the shows dealing with the oil industry came in late and were delayed in starting. Maybe you can arrange for one of them. The pictorial as well as technical quality of these prints is very high.

Camera Club Print Circuits

There is always a chance to get in on a Print Circuit. Your club will be benefited by comparing its work with that of other clubs in various parts of the country. All a club needs to get started is a dollar and three prints. Write to William R. Hutchinson for an application blank. Then make one person responsible for the transaction and be sure that he has the three prints in his possession when the application is filed, for things may happen faster than you think.

Port solian Clubs

In every PSA club somebody will be found who belongs to a portfolio circuit, and that suggests a possible source of program material. When my portfolio arrives, I take it to the local camera club so that others may share the thrill. If it comes at the wrong time, I have a special meeting called, for we are allowed to keep it only five days. Sometimes a special meeting on any pretext will wake up the boys.

The regular Portfolian Club movement is directed by Sten T. Anderson, APSA, and in the article that follows, he tells its story better than I can.

The Portfolian Clubs

STEN T. ANDERSON, APSA

For some time we have been writing about the function and operation of Portfolian Clubs. Of late we have received some letters, in which we find that the applicants erroneously assume that this "is just another camera club."

Decidedly, the Portfolian Club is not a "camera club." It was originated for the sole purpose of providing, for those who were serious in salon work, a means of viewing, criticizing, and profiting by having available greater numbers of prints offered by the Pictorial Portfolios.

The Pictorial Portfolios, in themselves, PSA JOURNAL, Vol. 18, Feb. 1952

provide an excellent means of getting criticisms from the members and the commentator comprising the circle. Circulation of the portfolio consumes time and often the "eager beaver" is prone to be found champing at the bit waiting for the return of his portfolio. The only solution to this unavoidable circumstance was to sign up for more Pictorial Portfolios. It was because of this desire that the Portfolian activity was proposed.

In its simplest form, it is operated by having local participants of the portfolios assemble at the home of one of the members of the group every time a portfolio arrived, to see and comment on the contents. The next step consisted in organizing such groups under a definite plan. The first group was organized at Owatonna, Minnesota, Dr. Warren Roepke heading up the activity. To further increase the henefits, sponsors were assigned to direct and collaborate with the work, thus providing the know-how of experienced salon exhibitors.

Your present Director, after taking over the work started by Dr. Roepke, was faced with the objection that the Portfolian Club (through the title it had at that time, "Portfolio Camera Clubs") was usurping the province of the local camera clubs. To overcome such an implied accusation, on March 1st, last year, the activity was re-christened "Portfelian Clubs" to more specifically define it, work. At the same time, the entrance requirements were eased to overcome objections raised by aspiring groups with insufficient PSA representation locally. The entrance quota of eight was reduced to four qualified members for organization of a Portfolian Club. A further proviso was that when the group had reached a membership of six, a sponsor would be assigned to further help them in their work.

These changes have increased the interest in Portfolian Clubs, and requests for information come from all parts of the country, which presages a substantial increase during the fiscal year.

As we have pointed out, the primary function of the Portfolian Club is to provide a means for intensive study of prints in the Pictorial Portfolios; and secondly, to develop the pictorial abilities of its members through local work on assigned subjects which in turn are evaluated by the sponsor, for further study and presentation. One has but to go through the process of organization of a Club and attend a few meetings to realize just how much this activity aids the striving amateur. Perception of flaws in prints becomes keener, desire to excel is enhanced and on the whole the member undergoes a transformation, with ability to judge, profit and exercise care coupled with thought in the production of his offerings.

These are not just idle statements but factual recommendations for the desirability of participation, by interested groups, in Portfolian Clubs. To those groups who aspire to more enjoyment and appreciation of good photography we unhestitatingly urge that they avail themselves of the opportunity to join and we extend an invitation to contact the Director of the activity

PSA Recorded Lecture Program

The Recorded Lecture Program of the Pictorial Division offers the following programs for your club.

No. 1. An Analysis of Recognized Salon Prints by Ragnar Hedenvall, APSA

No. 2. Commentary on Recognized Salon Prints by Morris Gurrie No. 3. Outdoor Photography by D. Ward Pease, FPSA

No. 4. Still Life by Ann Pilger Dewey, APSA, Hon. PSA.

No. 5. New Prints for Old by Barbara Green, APSA

SPECIAL Photography of the Nude by P. H. Oelman, FPSA

A deposit of \$25.00 should accompany an order. A service charge is made for each Lecture. The SPECIAL costs \$10.00 and should be ordered directly from Mr. Oclman. For clubs which are members of PSA but are not affiliated with the PD the charge is \$6.50. Clubs which are affiliated with the PD will be charged \$5.00. Clubs or groups not members of PSA will be quoted prices on request to the Director.

For Nos. 1 to 5 order from Philip B. Maples, Director, Recorded Lecture Program, 29 Spring Street, Brockport, New York.

For the SPECIAL please contact: P. H. Oelman, FPSA, 2505 Moorman Avenue, Cincinnati 6, Ohio.

who will provide information and application blanks.

A New Director

It is with pleasure that we announce the appointment of Fred Bauer, Jr., of Memphis, Tennessee, to serve as the new Director of the Camera Club Print Judging Service. If your club is interested in securing an unbiased evaluation of their prints, contact Fred for the name of a competent judge close to you. His address is in the masthead on the second page of this section.

INTERNATIONAL CLUB PRINT COMPETITION

ROBERT J. LAUER, Director

The Point System

This month's competition is being held at Rochester, N. Y., under the sponsorship of the Kodak Camera Club. Because of the time lapse between actual judging and publication of the PSA JOURNAL, it is impossible to give full details of the judging in this column immediately following each contest. However, all participating clubs receive an individual report within two weeks of the actual judging.

There have been some questions regarding the point system which determines the

rank of the camera clubs. There are two classifications, A and B, in which a club may choose to compete. Class A consists of the larger clubs, and the more active smaller groups. Class B is designed for the clubs which desire to start out slower, and work up toward the tougher competition encountered in the more advanced group. At the end of the year about 15% of the B group is advanced to Class A.

During the judging all prints are scored on the same basis, there being no breakdown into A and B. A minimum of one point is scored for each print entered, with a maximum ten points possible. (Each club may enter four prints, but not more than two from any one member.) The judges rate each print according to its merit on this basis. A really top-notch print appealing equally to all three judges could possibly score a full 30 points. This would be rare, however. The outstanding prints in each competition usually run from 20 to 25 points. The October first place winner, "The Philosopher," by Sam Cohen of the Oakland Camera Club won with 23 points. Actually, there will be a slight variation among the various juries, which is only natural--that is why it is necessary to contribute the best to each contest.

Although the total scores can vary several points each month, all of the clubs are in the same relative position, as long as they keep submitting good prints. Allowing ten points in the evaluation of a print, the better ones are built up to a higher score, and there is enough leeway in the middle brackets to eliminate continuous

After prints are scored, from one to ten points, the totals are entered on the club's entry form. While the prints are returned immediately to the participating clubs, the entry forms are forwarded to the Director of the International Club Print Competition, Robert J. Lauer, for preparation of the reports sent out to each club imme diately following the contest.

Trophies are awarded to the top scoring clubs in each class and medals are given to the top three individual winners.

Next month we will report the results of the December competition, held at Oklahoma City under the sponsorship of the Oklahoma Camera Club. The results of the February judging will appear in May.

October Competition Results

Here are the scores of the clubs which participated in the October competition:

CLASS A

Oakland CC—70, Baltimore CC—58; Photo Pictorialists of Milwaukee-53; Academy of Science & Art (Pittsburgh)—51; Science Museum (Kenmore, N. Y.)—49; Tiro de Los Padres (Halcyon, Calif.)—46; Berkeley (Calif.) CC—45; Grosse Pointe CC—45; Jackson Park (Chicago)—45; Western Reserve (Cleveland)—45; Niagara Falls CC—44; Shorewood (Milwaukee)—44; Delta CC (New Orleans)—43; Ft. Dearborn (Chicago)—43; Photo Guild of Detroit—43; St. Louis CC—40; Blackhawk (Iowa) CC—38; Rock Island (Ill.) CC—38; Venango (Oil City, Pa.) CC—38; Queen City Pictorialists—37; Green Briar (Chicago)—35; Lawson (Chicago)—36; Memphls CC—36: Germantown (Philadelphia)—33; and San Luis Obispo (Calif.)—33.

CLASS E

Mission Pictorialists—57; Orleans CC—46; Maywood (N. J.)—43; Atascadero (Calif.)—39;

Bell CC of Denver—39; Erie (Pa.) Photographic Society—38; Endicott (N. Y.)—36; Saskatoon (Canada) 36; Ft. Steuben (Steubenville, O.)—35; Mysore Photographic Society (India)—35; Tripod CC (Dayton)—35, Waterloo (Ia.) CC—35; Oklaboma CC—34; Owego (N. Y.) CC—34; Balco (Rochester) CC—33; Bartlesville (Okla)—33; Bremetton (Wash)—33; Mid South (Memphis)—33, Sious Falls YMCA—32; Albany CC—30, Central Florida CC—29, Ogden (Utah) CC—29; Richmond Vicw Finders (Calif.) 29; Turson CC—29; Keene (N. H.) CC—27; Independence CC (Mo.)—26; Lewis Clark CC (Washington)—26; Spokane CC—26; Portland (Maine) CC—25; Southern Ohio CC (Cincinnati)—22; Boulder City (Nev.)—21; Stillwater (Okla)—21; Silver Bow (Nev.)--21; Stillwater (Okla) 21; Silver Bow (Montana)—20; Federal Reserve (Richmond. Va.)--17.

VIEWS AND REVIEWS

BY THE EDITOR

This Above All

So you're not getting anywhere in the exhibitions! You make marine pictures that rival those of John Hogan and Aubrey Bodine (at least you think so), you take architectural shots that will stand up in any exhibition with Frank Heller's work, and you've even journeyed to a picturesque factory down on the outskirts of town to do some industrial pictures a la Doris Martha Weber. But still you aren't getting anywhere in the exhibitions.

Of course, when your friends spot some unusual character and ask for help in taking his picture-now that is the thing you like. But what jury takes this kind of thing in an exhibition, you ask. Sure, you're crazy about taking interesting, imaginative character pictures-but, gee gosh, none of the other super-duper picture makers do that kind of thing, it's a bit out of style now, so if you're going to make a big exhibition record (you say to yourself, sorrowfully), you'd better go out and struggle to make the kind of pictures that the Four and Five Star Exhibitors turn out all of the time.

In other words, you've tried imitating the more prolific salon exhibitors, and their subject matter leaves both you and the exhibition judges you've submitted to very cold. All you seem to get is lots of big zeros.

Why?

Who am I to tell you why your prints don't click with certain judges (I find the same prejudiced point of view toward some of my efforts).

But there is one thing I am sure of as sure as I am of anything—and that is that if you are taking a picture which is not of interest to you, that picture will not be one of your best. For to be the best work of which you are capable, it must have that indefinable spark which conveys to the viewer as well as to you that this picture is something which had to be taken because it meant so much to you that you had to share it.

Yes, imitation is a good way to get started. But if you imitate to create, as was suggested last month, imitate wisely. Don't use subject matter in which you have little interest just because someone has done well with it.

Be yourself. Choose the things you are interested in to picture. Imitate if you will -- imitate wisely, but never cease to express yourself in your own way. Don't do things because everyone else is doing them. It was true in Shakespeare's dayand it is equally true now and for the time of the future -"This above all: to thine own self be true."

If you are true to yourself, your personality cannot help but shine from all of your pictures-and you will have achieved greatness in your own niche.

Johannesburg, So. Africa.

First International Exhibition of the Associacao Brasileira de Arte Fotografica (M), Rio de Janeiro, Brazil, June 14, 1952. Closing date - March 30, 1952. Entry forms for Canada, Mexico and USA from Ray Miess, 1800 N. Farwell Ave, Milwaukee 2, Wisconsin or Rua Santa Luria 173, conjunto 705, Rio de Janeiro, Brazil.

PSA NATURE DIVISION

HARRY R. REICH, APSA

286 Schenck St., No. Tonawanda, New York

1 HE. Fourteenth Buffalo International Exhibition of Nature Photography. Sponsor--Science Museum Photographic Club. Last day for receiving prints and slides--April 22, 1952. Judging date-April 26, 1952.

For information or entry forms address inquiries to Science Museum Photographic Club, Buffalo Museum of Science, Humboldt Parkway, Buffalo, New York.

Nature Represented in Tops Show

The PSA "Tops in Photography" show which opened in January and is scheduled to make several appearances in the south and west is truly what the title implies, namely, the tops. The Nature Division is well represented in this show. It includes fifty prints and sixty slides, the best work of some of the top nature photographers in this country and Canada. While the subject matter of both prints and slides is strictly nature material, the pictorial quality and appeal is such that the nature section of the show offers stiff competition to the pictorial section.

I would recommend to all nature enthusiasts that if this show is scheduled for your section of the country, you make every effort to see it as it will make you feel a just pride in your chosen field of photography. Needless to say you will also be helping to make the "Tops" show a

Nature Division Growing Rapidly

It is truly gratifying to the executive committee of the Nature Division to note the rapid growth of the Division during the past year. The committee feels that the member-body of the Division would be interested in the fact that during the three months of September, October, and November 1951, eighty-one new members enrolled in the Division. While this figure might not appear too great at a glance, when one stops to consider that this represents sixteen percent of the entire enrollment it immediately assumes a greater significance.

This increased enrollment in the Nature Division could be due to a general increased interest in nature photography or it might be due to other reasons. The executive committee, however, is not going to concern itself with the reasons for the stimulated growth nearly so much as it is with keeping the membership interested and in this way reduce the mortality rate in the Division.

Ways and means for stimulating interest and for broadening the program of the Division are presently being considered and it is hoped that some announcements can soon be made. It might be told that a west coast group is interested in sponsoring a new nature exhibition, and another international exhibition is considering adding a nature section to their exhibition. Two additional nature exhibitions would give added impetus to our growth.

Some consideration is being given to the establishment of an interclub nature print contest, somewhat like the Color and Pictorial Divisions are conducting. The writer would like to hear from the clubs affiliated with the Nature Division, and for that matter from any club affiliated with the Society. Several camera clubs have already indicated and specified an interest in such a competition. If there is sufficient interest displayed by affiliated clubs, it could be arranged to conduct an interclub contest next year.

Nature Contest Rules Clarification

Just prior to the January Nature Print Contest a query was received from a camera club with Nature Division affiliation, anent the contest rules. In view of the nature of this question it might be well to repeat it here.

Our club has joined PSA as an organization with Nature, Pictorial, and color affiliations. Your contest rules stipulate limit of four prints per individual. Just how does that affect us?

Can we send four prints, honors to go to the club? No fee.

Are we, as a club, ineligible?

Can each member send four prints and pay fifty cents entry fee?

Is your contest only for individual memberships?

Just what do you mean by non-members? In other words, can any outsider at all enter just for fifty cents, with no PSA affiliation?

The contest is for individuals and is not a club activity so only individuals are eligible. Honors therefore are issued to individuals only. Rule #2 indicates a limit of four prints per person, which means that every member of a club can submit four prints if they so choose. As the contest is for individuals rule #7 would cover individual members of the Nature Division and would indicate that there is no fee for members of the Division. The second sentence in rule #7, which states that for all others the cost is fifty cents for each contest, would indicate that any individual was eligible to submit prints with the only stipulation being that there is an entry fee of fifty cents for any individual who is not a member of the Division. This would answer the question as to what ir meant by non-members and would also indicate that any person is cligible whether he be a PSA member or not.

We thought it best to cover this matter in the Nature Column in case any other camera club might have questions.

PSA COLOR DIVISION

George F. Johnson, APSA

Forestry Building, State College, Penna.

IN THI. Color Division column of the October 1951 issue of PSA JOURNAL, Mrs. Vella L. Finne told us of her pleasure and experience in getting together a group of slides for the CD Hospital Project. Now through the kindness of the American Red Cross in Tokio, in supplying us with a copy of a letter written to Mrs. Finne, we are able to give you the other side of the story. We quote from this letter written by Mrs. D. V. Armstrong, Chairman, Community Service to Hospitals, American Red Cross to Mrs. Finne:

"As we in our Tokyo Volunteer Red Cross Headquarters went through the latest boxes of color slides sent to us through Mr. Baumgaertel of the PSA, your name appeared so frequently as a donor that we want to send you our personal thanks on behalf of our hospitalized serv icemen.

"Not only was your contribution exceedingly generous but amazingly beautiful. When I look outside at our raw and rainy weather and think of our United Nations servicemen who are lying in hospital beds here in Japan and in Korea, I am deeply grateful to you and your friends for providing them with the many bright hours of entertainment they have enjoyed through your collections of color slides.

"The bulk of our slides are being sent to Korean Field Hospitals but as the word gets around we are being besieged with requests from other hospitals in the Far East Command, so there seems to be no limit on the amount we can put to good

"Our hospitalized United Nations servicemen would, if they could, join me in saying "thank-you" in a dozen different tongues for this is a donation which has broken the language barrier and helped immeasurably with the recreational facilities available to them."

At the time of writing Mrs. Finne was responsible for the receipt by us of more than 5000 slides, several thousand of which came out of her personal files. Not all of us can secure slides in such quantities. It should therefore be understood that any slides at all that can be contributed, even if it is only one single slide, will be deeply appreciated and will give a lot of pleasure. If possible, slides should be identified as to locale or subject. This identification need not be elaborate.

Karl A. Baumgaertel, APSA, who handles the project, will be away on a trip for his health during February and early March so get your slides together now, identify them and sometime soon after March 15th mail them to Karl A. Baumgaertel, APSA, 353-31st Avenue, San Francisco, California. Although Mr. Baumgaertel will be away for a period of time

there will be no cessation in our service to the Army, Navy and Veterans Hospitals in both this country and the far east, as arrangements have been made to keep the hospitals supplied with the more than 5000 slides a month they are now receiving.

"Scores"

Those of you who always seem to get the low scores in PSA National Contests probably think the judges are ogres who pounce gleefully upon each slide, especially yours, and tear it to shreds.

This is not true. Persons who are chosen to judge your slides are selected because they have carned a reputation for outstanding achievement in photography. Once, they were beginners and amateurs just like you. They are conscientiously interested in helping you toward the same success. They would prefer to give you a higher score.

Success in photography is never a matter of luck. You must earn your laurels.

Unfortunately, the great number of entries do not permit judges to take the time with each slide necessary to give detailed suggestions for improvement.

For you who live in districts where there are few qualified photographers who can give you personal advice, it is discouraging never to learn just why your scores remain in the lower bracket.

Perhaps a better understanding of how PSA contests are conducted and how scores are determined will enable you to raise your score in future competitions.

All PSA color contests are judged by a panel of three judges. Each judge must award from one to four points to each slide. These points are based upon: (1) Composition. (2) Interest Value. (3) Technique. Authorities on all creative endeavor agree that there is seldom anything created by man that cannot be improved. This is why few slides receive four points from any one judge and why the maximum total of twelve points is seldom awarded.

If your slide received a low score of from three to five points this indicates that each of the three judges considered your slide inferior for one or all of the reasons named.

By the law of averages, it is seldom that all three judges could be wrong.

Let us analyze a hypothetical total score of four points. To arrive at this score two of the judges had to vote one point each with the third voting two points.

This would mean that one judge believed the slide to be poor only in Composition, or Interest Value, or Technique. Therefore he gave it two points.

It would show that the other two judges decided the slide was poor in two of these

qualities consequently awarded it only one

Naturally, none of them included that extra point for 'near perfection'.

By similar analysis of each score, you can determine how the judges voted.

Study your slide. You should be able to discover whether it failed in Composition, Interest, or Technique.

In future columns I shall take up each point and attempt to help you to a better score.

Remember, you are competing with the finest when you enter any group in a PSA National Contest. It is up to you to determine how high your slide will rate by sending the best it is possible to make. Vella L. Finne

Foreign Exchange Sets

To enable American slide makers to see the work being produced elsewhere in the world, and for foreign workers to see American slides, the International Slide Set Exchange was set up by the Color Division in 1947.

The plan works this way: the Color Division sends a set of 50 slides to a foreign cooperator and receives a set of 50 slides in exchange for circulation to camera clubs in the United States. After quite general circulation, the sets are returned.

Many foreign countries have cooperated in the past. To continue this service with maximum efficiency, the Color Division is anxious to hear from individuals or camera clubs in foreign countries who have or can prepare sets for international exchange. Correspondence should be addressed to the Color Division Supervisor, F. B. Bayless, 320 Cowell Avenue, Oil City, Pennsylvania, U.S.A.

New Members

New members in the Color Division during one recent month totalled 164, representing 28 different states, District of Columbia, and seven foreign countries. The eight leading states in this total were California, Michigan, New York, Illinois, Pennsylvania, New Jersey, Ohio, and Oregon. New Zealand led among the foreign countries.

Have you tried to interest others in PSA and Color Division membership? A lot of CD members are doing it and enjoying the experience. Why not try it?

First Sterco Competition

The interest and response to the first stereo competition sponsored by the Color Division, was most gratifying according to a report from George W. Blaha, supervisor. There were 14 entrants with a total of 53 slides. Judges were Dr. Frank E. Rice, APSA, Earl E. Krause, and George W. Blaha, APSA.

Winners were as follows: lst--"Sea Gull Parade"--Henry C. Crowell, Winnetka, Ill.

2nd-"Willemstad Dock"-Mrs. Charles R.

And—"Willemsiau Walgreen, Chicago.

3rd—"Lady News Vendor"—Wayne J. Brown,
San Francisco, Calif.

4th—"Trees and Falls"—Julius Wolf, Chicago.

Honorable Mentions:

Windjammer"-Henry C. Crowell, Winnetka.

"Ambitious Bush"- L. B. Dunnigan, Royal Oak, Michigan.

"Birch Trees" W. C. Miller, Queens Village. New York.

The closing date for the next contest is February 20, 1952. Send your slides to George W. Blaha, 4211 Harvey Avenue, Western Springs, Illinois.

EDITORIAL NOTE: -As has been previously announced, a Stereo Division has been created by action of the PSA Board of Directors. This stereo competition is one of several activities sponsored in the past by the Color Division which will be transferred to the new Division as soon as it is fully activated.

Mount Your Slides

The Color Committee of the Photographic Guild of Detroit has taken a progressive step in ruling that all slides for Guild competitions must be mounted in glass and spotted.

Leonard A. Thurston, Color Chairman of the Guild, reviews the reasons for this ruling in a recent issue of Photo Guild Bulletin:

Your color committee has requested that you mount your slides in glass, and spot them for Guild competitions. There are several sound and basic reasons back of this request. It might be in order to review them.

The Photographic Guild of Detroit has a repu tation to uphold. It has always taught its members the rules that a good and successful salon exhibitor must practise. Both print and color slide nights are planned for more than enter-tainment; the primary purpose is to train you to better pictorialism, and to prepare the new members for the exhibition circuits; also to keep the older members from getting lazy. It is for this reason that no print will be accepted for judging mounting board

This is also one of the reasons that no slide will be considered unless it is properly mounted in glass, and spotted in the lower left hand corner when held right side up.

Another reason is to save the projectionist trouble. Prints do not go up on the easel upside down, or wrong side to. Why should the projectionist who must work in the dark be allowed to guess? The result may be the first presentation of your clide upside down. If this happens to your slide upside down. If this happens to your slide it may lose that first impact that is so necessary to a good slide. Impact will often put slide into the win column. The very first impact carries more shock. Do not loose it by improper spotting.

Another thing your officers recognize, but which you may not have thought much about: your prize slides are more valuable than the best black and white prints. You cannot duplicate a damaged slide; you may not even be able to duplicate faithfully an undamaged slide. A prize print can readily be duplicated from the original negative, and by the maker. Can you duplicate any of your slides from the original transparency? Your

HONORS APPLICATIONS DEADLINE

Because of the earlier date of the 1952 PSA Convention in New York City, the deadline for applications for Honors' consideration has been moved up to March 1st.

All applications must be submitted on new forms; don't use any old ones that may be available. Obtain the revised form from PSA Headquarters, 2005 Walnut St., Philadelphia 3, Penna

Applications must be received in Philadelphia no later than March 1st for consideration this year.

officers do not want to run the risk of damaging any of your slides; it could be a prize one. member it is easier to have an accident with an unmounted slide.

There is also the matter of focusing. Mounted slides usually require little focusing. Mounted slides usually require little focusing. Once focused they stay put. Unmounted slides do not stay all over sharp. If the projectionist is just a little careless your sharp slide may be thrown out because the judges considered it soft. The Color Committee want you to receive all the consideration to which your efforts are worthy.

It is hoped that this will clarify the stand taken by your officers. The only exceptions will be visitors, and first-night members. All others will turn them in properly mounted and spotted.

Seeing Color

When one considers the burgeoning growth of interest in color, it is not surprising to note the disposition to be critical of the camera's rendition of certain colors. Indicative of this was a conversation the writer heard recently, when two embryonic color enthusiasts heatedly argued over the "correctness" of some colors in a transparency.

Now it must be admitted that before one is qualified to evaluate any degree of nuance in a hue-or color they should first develop an ability to see colors objectively. This ability, naturally, does not come to anyone overnight, nor is it taught in "five easy lessons," for the "seeing" of color more accurately is the result of training, study, and experience, with the rate of progress dependent upon one's love of color, energy and determination.

The artist is a good illustration of this for experience has taught him to see objects, not as he knows them to be but as they appear to be. Certainly the artist knows that the distant hill is covered with green grass, yet he paints it in a soft violet for that is how it appears, and that is how the objective eye of the camera perceives it.

Consider the difference between the human eye and that of the camera. The former "sees" objects and scenes by way of a brain that is tremendously influenced by personal likes and dislikes, misinformation regarding the science of color, imperfect vision, and subconscious psychological reactions to certain hues. On the other hand, the lens is objectively mechanical and interprets what it "sees" only within the limitations of the sensitized film. This does not imply that the camera's eye is the ultimate in color rendition, for it is not, but placed in the hands of one who understands his camera and his medium, the results will more readily impress the competent judge of color.

Let's not fall into the error of adjusting the camera's eye to conform to our limited sense of color evaluation. It will pay big dividends eventually.

JAMES H. ARCHIBALD

Coming Color Exhibitions

Philadelphia, March 8-30, deadline February 16. Four slides, \$1. Forms: Clarence A. Rossman, 1637 S. 54th St., Philadelphia 43, Pa.

Rochester, Mar. 7-30, deadline Feb. 14. Four slides (including 234), \$1. Forms: R. F.

Edgerton, 11 Fireside Dr., Rochester 18, N. Y. San Francisco (Photochromers), Mar. 15-22, dead-line Mar. 1. Four alides, \$1. Forms: B. H. Ladensohn, 3140 Clay St., San Francisco 15, Calif.

PSA JOURNAL, Vol. 18, Feb. 1952

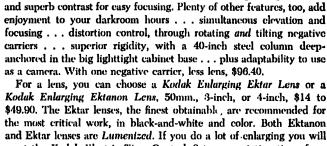

For Better Prints...

The Kodak BULLETIN

better darkroom equipment

Whether you are just about to equip a darkroom or want a piece of equipment for a very specialized application, your Kodak dealer is ready to show you Kodak equipment that is exactly matched to your needs. For example—

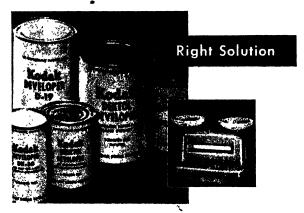

Enlargements that really sparkle are yours with a Kodak Flurolite

Enlarger. Reflected "cold" fluorescent light gives high printing brilliance

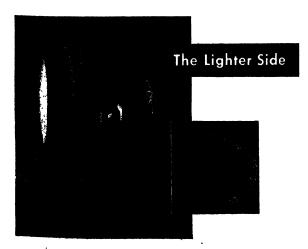

Kodak Enlarging Ektanon Lens, 50mm., 3-inch, or 4-inch, \$14 to \$49.90. The Ektar lenses, the finest obtainable, are recommended for the most critical work, in black-and-white and color. Both Ektanon and Ektar lenses are Lumenized. If you do a lot of enlarging you will want the Kodak Electric Time Control. Set your printing time—from 1 to 57 seconds—and plug the enlarger into the unit. At the end of the printing period it turns your enlarger off automatically—and will repeat the operation as many times as you wish. Continuous light for focusing. No clock watching, and both hands are free. Price, \$13.50.

With Kodak Photographic Chemical Preparations you are always sure of the right solution. You merely add water to these specially mixed, Kodak-tested compounds. You save work and gain time for more creative darkroom pursuits. Whether you are using Kodak Dektol Developer with its 20% greater print capacity than D-72, its 50% better keeping qualities, and its excellent development rate, or Kodak Fixing and Stop Baths, Toners, Intensifiers and Reducers . . . you will find them all of the same fine quality, uniform from batch to batch.

If you prefer to mix your own special formulas, you will appreciate the precision help of the Kodak Chemical Scales. Marked for both avoirdupois and metric systems, a hair-line indicator makes accurate reading easy. Avoirdupois weights are supplied. Tenite pans have lips and handles shaped in. \$9.90.

If you want to develop your 35mm. films without fumbling around in the dark, a Kodak Day-Load Tank is the answer. Loading, developing, and fixing can be carried out in full daylight. Price, \$9.85. When it comes to printmaking and the other darkroom operations, you will want light that's adequate to see by, but safe for your light-sensitive materials. The answer here is a Kodak Safelight. The Kodak Adjustable Safelight Lamp, pictured at left, can be attached to wall, shelf, or bench. Adjustable bracket can be angled to any desired position. With a 5½" Series OA Wratten Safelight, \$7.05. The Kodak Utility Safelight Lamp, Model C, is designed to provide ample over-all darkroom illumination. Made for ceiling suspension, it gives indirect light through a 10 x 12 Wratten Safelight. With chains for easy ceiling hanging and a Series OA Filter, \$12. A wall bracket may also be obtained for \$1.85.

Prices include Federal Tax where applicable and are subject to change without notice.

Experts' Choices For Fine Prints

No. 2 of an informative series on how leading exhibitors choose papers to fit their salon aims

FULL SAIL." (on facing page) has hung in forty-three leading salons—and has never been rejected. In his exhibition print, Mr. Silberstein required a vigorous interpretation; a full, brilliant tonal scale from clear highlights to richest darks; a sparkling surface adaptable to retouching; and an emulsion amenable to toning. He chose a long-time favorite, Kodak Illustrators' Special—a fine reproduction paper, beloved by professional photographic illustrators whose work

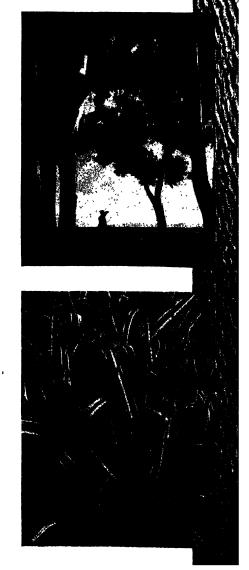

must survive the most critical appraisal and justify prices in three and four figures.

Mr. Silberstein likes not only the exceptional image quality of *Illustrators' Special*, but also its lustrous fine-grained "E" surface, which retains a broad, brilliant tonal scale without the specular reflectance of glossy stock. He also feels that, when toned in his favorite gold-thiourea formula, *Illustrators' Special* yields a finer blue tone than any other paper.

Fine exhibition papers, such as *Illustrators' Special*, Kodak Opal, and Kodak Ektalure G, are relatively low in speed. Many meticulous workers prefer this moderate speed - it allows more time for dodging and local printing. For those whose standards are also high, but whose darkroom time is limited, there are excellent high-speed alternates in the Kodak line of fine papers. Kodak Medalist Paper, warm-black, and Kodabromide, cool neutral-black, are about six times as fast as Opal. Kodak Platino, warm-black, is intermediate in speed. All of these papers offer an excellent choice of print surfaces, and grades for both "soft" and "hard" negatives. The small reproduction of Frank J. Heller's "Eucalyptus" (to appear full-page later in this series) is on Kodabromide F.

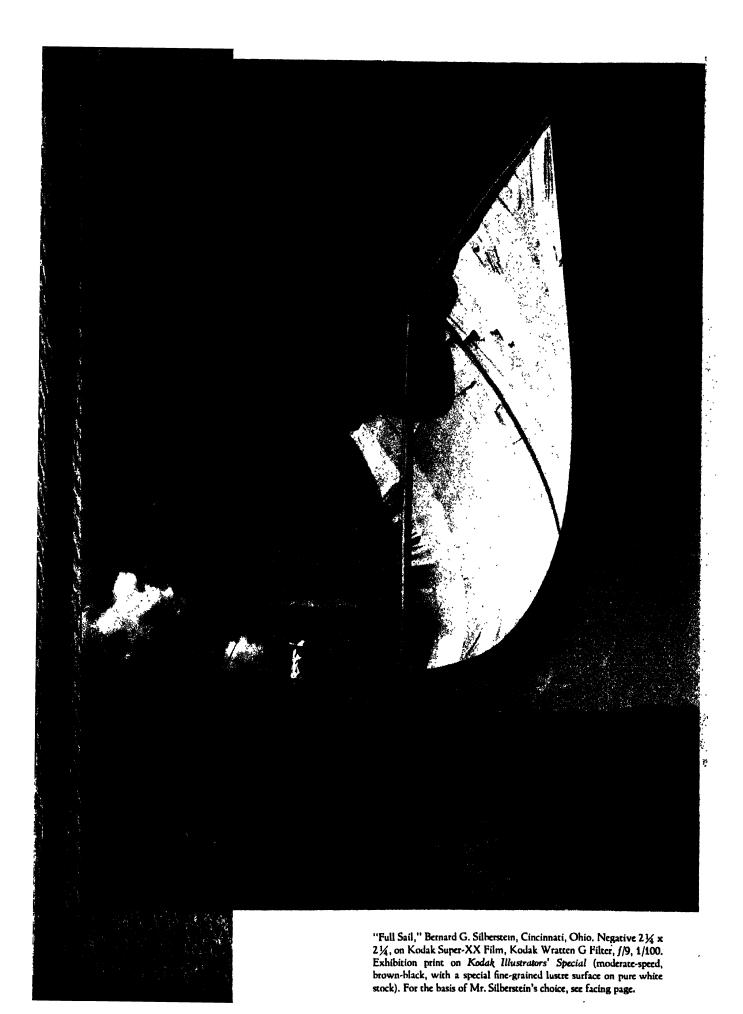

TEXTURE, OR NONE? It depends on your aim—and there's a Kodak paper to fit every interpretive need. For "Pattern Motif 283," at right, Axel Bahnsen chose glossy Kodahromide F. His print will appear full-page later in this series. In addition to glossy. Kodak papers offer the discriminating exhibitor many other valuable surface textures—smooth lustre, fine-grained, rough lustre, silk, suede, tapestry, tweed, and others—and white, cream white, and rich old ivory paper stocks.

Know your Kodak papers, for knowledge spells success. For fine exhibition enlargements, gift prints, home decoration—choose from warm-black Medalist and Platino, brown-black Opal, Ektalure G, and Illustrators' Special, and neutral-black Kodabromide. For special applications, Kodak Mural R, Resisto Rapid N, Opalure Print Film, Translite Paper. For contact prints, Kodak Azo, Velox, Resisto N, and others. Your Kodak dealer has full details.

EASTMAN KODAK COMPANY, ROCHESTER 4, N. Y.

BOOK REVIEWS

LUCKY, THE FAMOUS FOUNDLING, by Nina Leen and Ray Mackland, A. A. Wyn, Inc., New York, N. Y., 94 pages, 8 x 10½, illustrated, cloth, \$2.00, 1951. This is a photographic book about a dog. Also, it is a dog book about photographs. Dog-lovers who like cameras, or camera-users who like dogs, will find it equally delightful and will feel themselves well repaid for investing the cost of admission in so enjoyable a treatise on canines

and cameras.

"Lucky" is a dog who was found, as a puppy, beside her dead mother in the Texas Panhandle. She was air-expressed to Nina Leen, a "Life" photographer, at New York, and embarked upon a canine career which brought fame to her, new delights in the camera to Nina Leen, plenty of magazine and newspaper copy, and a text-writing job for Ray Mackland. Leonard McCombe, a "Life" photographer, gets into the book, too, as the discoverer and co-photographer of "Lucky."

This book presents a precious dog's-eye view of life, using both camera and text for the unique job. Whether the photographs are "salon cliches," as the modernists say, or of "modernistic tripe," as the salonists retort, escapes the reader. The pictures are photographs which carry the viewer along from one dog thrill to another, with the text serving as commentary.

Those who are interested in what can happen to an extremely fortunate canine had better get the book and find out. Those who wonder how a series of interesting photographs can be made from one subject can study the 114 shots of "Lucky"

and get an excellent course in picturemaking at less than two cents per picture. Also, they'll start thinking about the real possibilities of the camera.

THE BOOK OF CATS, edited by Brant House, A. A. Wyn, Inc., New York, N. Y., 100 pages, 834 x 12, illustrated, cloth, \$2.00, 1950.

From a small-animal point of view, this world is inhabited by two kinds of people—cat people and dog people. This book happens to be for cat people, and photographers. Actually, it is the photographers' book about cats. Not necessarily top-flight, big-name photographers, but lots of photographers, men and women, amateurs and professionals. They have stalked and snapped the cats in a multitude of places and activities; cats as kittens; cats as cats; and cats as people, almost.

This book is comprised almost entirely of photographs, hundreds of them, each given a snappy title to produce a good laugh. Amateur photographers can enjoy this book, get a few laughs, then start some serious thinking about breaking out the camera and stalking the nearest cat. Only one subject here, the cat, yet treated so interestingly in so many different ways, and so well, as to prove for all time that the camera certainly isn't monotonous. Cats definitely aren't monotonous. The trouble must be with people!

Grand book for cat folks and camera folks, and, for cat-and-camera folks, positively "must" reading.

FUNDAMENTAL MECHANISMS OF PHOTO-GRAPHIC SENSITIVITY, Edited by J. W. Mitchell, Academic Press, Inc., New York, N. Y., 347 pages, 7x93/4, illustrated, cloth, \$9.50, June 1951.

This valuable technical volume presents

the proceedings of a conference on photographic sensitivity held at the University of Bristol, England, in March 1950, as the third of a series started at Liege in 1948 and continued at Zurich in 1949. It contains the texts of nearly 50 technical papers treating of physical properties of silver halides, production and properties of silver halide grains in photographic emulsions, photographic sensitivity, latent image formation, and nuclear track emulsions.

The amateur eventually will benefit by the end-products of this technical material. Meanwhile, the book is a first-class reference volume for the photographic technician, and particularly the technician interested in the theories and processes of image formation. It appears that numerous theories explanatory of photographic sensitivity and image formation have been developing with the growth of man's technical knowledge. Some of the theories are acceptable to some of the technicians, but no generally-acceptable theory has evolved as yet.

The editor, J. W. Mitchell, essays in one chapter to present critical accounts of the situation from a post-conference point of view. He outlines the evolution of scientific thinking on the subject, beginning with the Gurney-Mott theory of 1938, and reviewing present and prospective lines of thought. He explains present belief that the phenomenon is, like the theories, much more complicated than originally was supposed, and reports that while present conclusions appear to coincide with photographic experience, further experimentation and interpretation is necessary.

Each of the nearly 50 technical papers in this book comprises a step toward improved photographic films, developers, processes. The volume constitutes a worthy contribution to photography's technical literature.

Johnny Appleseed's Correspondence

Flushing, N. Y.

DEAR JOHNNY:

I would like to add some personal comments on a phase not covered by your interesting "How To-Make Marine Pictures," namely, taking marine sunrises.

If you can wake yourself about 4:00 AM, you have possibilities of getting some beautiful and interesting pictures. Naturally, successful marine sunrises require the sun. In addition, the rising sun should be partially obscured or subdued by fog, haze, or ribbons of clouds. With a bald sky, the sun pops up in a minute—one shot—and its too bright to shoot in the direction of the sun.

I like pan film, using a lens shade, no tripod and no filter. Exposures run from f/8 to f/11 at 1/50 on Plus-X. If you want to use an exposure meter, I've gotten good results by pointing the meter at the water, right angles to the direction of the rising sun. Cut the film development one third. On most shots, use of the hyperfocal distance will speed things up and be adequate. Shoot fast, from different viewpoints and include in addition to the sun, interesting foreground (waves, boats, etc.). With fog or clouds present, pictures can be taken for almost ten minutes, into the sun, without fogging film.

But remember, this adventure begins at 4:00 AM.

BARTON KING

DEAR MR. KING:

Thanks for your comments.

Have you ever speculated on the percentage of really good, top-

notch pictures made before 6:00 AM or after 6:00 PM? My guess is you'd find a high proportion. Most landscape and marine photographers work the wrong time of day, when sun is high.

JOHNNY APPLESEED, APSA

_ _

Trappe, Maryland

DEAR JOHNNY:

There is a problem that has been bothering me for some time and I have an idea that you can supply the answer, so here goes. I sometimes use the following as a print reducer

A-10% Potassium Ferricyanide B-10% Ammonium Sulphocyanide

To use:-

Solution A— 1—Part Solution B— 10—Parts

Water to make 50 Parts

This works fine in removing spots from gold toned prints and sepias as well as the well washed black and white. For spots I use less water. For large areas using the full dilution it seems much easier for me to handle than Farmers as it is not so jumpy. I expect you have used it, but my problem is just what is the proper after treatment. I have used alcohol as well as plain water but am uncertain as to the lasting properties after those treatments and am wondering if any other treatment is necessary. Do you have the answer?

THOMAS T. FIRTH

DEAR TOM:

I have never used the reducer you mention, but it seems safe to say that thorough washing is the only requirement for getting

a print with a permanent image. This means an hour or more in running water, with good circulation over the image and no more than two or three prints in the tray at one time. A similar technique is really needed for any reduced print, regardless of formula. No other treatment should be necessary.

Maybe someone who reads this comment can supply additional information from his experiences. JOHNNY APPLESEED, APSA

* * * * *

DEAR JOHNNY APPLESEED:

In the October issue of PSA JOURNAL (page 643) under the heading of Portfolian Camera Clubs I find the following phrase "mail order camera club member."

In fairness to 11 operating Portfolian Clubs I should like to know who coined this phrase which so incorrectly describes the work of this activity. Also I would like to know just what is the meaning of this.

Secondly, this activity on March 1st of last year divorced the "Camera" appellation in its title on the premise that we were not and did not presume to be a camera club.

In the period associated with growing pains of this comparatively new activity, we do not want to have a wrong impression go out relative to the function of the Portfolian Clubs.

As an extension of the Pictorial Division Pictorial Portfolios, the Portfolian Club groups portfolio participants in a local area or city for serious study of the portfolios received by their members. By grouping, the members have available a greater number of prints to evaluate and profit by than are afforded by the Pictorial Portfolio program. Meetings are held in the homes of the members whenever a portfolio arrives and the term "mail order" is a misnomer in every sense of the word.

We have just returned from the PSA Convention in Detroit where we appeared on the program of the Pictorial Division general meeting to explain the function and operation of the Portfolian Club activity and were chagrined, on opening our copy of the JOURNAL, to find the above mentioned reference in your article.

STEN ANDERSON, Director, Portfolian Clubs

.

DEAR JOHNNY:

A perennial subject for argument among photographers is the merit of wooden tripods compared with metal ones. The following is a case in favor of the wooden one, as I see it. I hope you'll publish this letter and that it will draw you or some member out to defend the metal tripod in some future issue of PSA JOURNAL.

The wooden tripod has some elements in its favor which endear it to many photographers, more particularly to the professionals and the newspaper camera men. I can recall a comment in some notes made at a lecture by Frank Scherschell, well known news photographer and instructor in photo-journalism. He strongly advocated the Crown type of tripod for news photographers' use and demonstrated that he could make one do almost anything but sing and dance. Much of this is associated with its flexibility due to the freedom from restriction on the angle that the legs can take with the head. This flexibility shows up best on a hillside or extremely irregular ground where the "double-jointed" limberness

In spite of all of this flexibility, the wooden tripod is not limber or unsteady. If it were, it would not have the favor that it does with the men who depend on their cameras for a living. The wide and firm attachment of the legs to the large diameter head takes care of that. In spite of all this, it is probably lighter, and when disassembled and folded up, more compact than any other form. In addition, it is much less expensive than anything else that will carry the same load. Its durability is attested by its popularity in those same circles.

I have one which has served me very well for about fifteen years. This does not mean that I have not had to do a little work on it from time to time, but I know from experience with it and other types that repairs are easier on the wooden form. I recall an instance of a camera club group outing in a dunes area. One of the girls had some trouble when some sand got into one of the screw type lock joints of her shiny new tubular metal tripod. One of the gentlemen offered to clear the trouble and got a bit too strong, with the result that the tripod went back to the factory for repairs. I can safely recommend the wooden tripod in snow or

the mud of a creek bank. Many times I have done just that, then swished the tips around in the creek to wash off the mud.

The properties which set the wooden tripod off as preferable for some uses lead to slight differences in working methods. On floor or level ground, no great difference of original set up is evident. If one leg is pointed straight forward, or straight backward, easier levelling results from forward or backward, or sideways movement of that leg. Extension of the same technique, plus some leg shortening on the high side takes care of uneven ground. Rubber cane tips from the dime store guard against most possible slippage, although I know of one professional who loops a piece of stout cord through the square openings of the upper joining of his Crown tripod and ties it in rather snugly before putting his 8 x 10 Deardorf on top.

There is no reason why a metal tilt and panoram top cannot be used on the wooden tripod. I have done it for years and find it a good combination. Even without such a top, much in the way of tilting can be done with the tripod alone. With one leg to the front under the lens and shortened, a considerable downward tilt is possible. The opposite with the leg in back gives the upward tilt. There is another trick where by starting with one leg straight back, then swinging it to the front between the other two a surprising downward tilt of the head occurs with the tripod apparently standing straight up.

There is another shortened leg trick which will work with any tripod. If you are backed against a wall and want to get your camera as close to it as you can, shorten the back leg and let it hang while the wall and the other two legs carry the camera. Set up the wire frame finder (if your camera has one) and by walking out in front along the line of the frame and the back sight you can find out where the boundaries of your picture area are and make adjustments accordingly.

I would hardly suggest the wooden tripod for the small camera, but for anything from about 3½ x 4¼ on up, it is hard to beat.

D. WARD PEASE, FPSA

DEAR WARD:

Thanks. Let's see what this brings from others.

JOHNNY APPLESEED, APSA

Take Gorgeous Color Pictures Indoors

Easy and sure with a

KALART.

B-C Flash Unit

Remember, color film is much slower than black and white film Moreover, you can't correct over or underexposure in the printing process Your exposure and lighting for color film must be right on the nose. Right here is why a Kalart B-C Flash Unit is worth its weight in gold. It guards against the most common cause of flash failure—underexposure due to weak batteries. A Kalart B-C uses a new superpower method of firing flash lamps. You get peak performance from every lamp every time.

The high efficiency of a Kalart B-C Flash Unit assures excellent results with only one flash lamp. Or you can easily give your color pictures beautiful Hollywood lighting effects by using one or more Kalart B-C Flash Extension Units. Nothing extra to do except plug them in. With Kalart B-C, you have ample power to synchronize 2, 3, or up to 6 lamps.

A Kalart B-C Flash Unit further pays for itself by guarding against missed pictures and waste of costly color film. Its built-in test light provides a quick, dependable way to test each lamp and the flash firing system before each shot. Ask your photo dealer for a demonstration.

There's a Kalart B-C Model for Almost Every Camera — Old or New

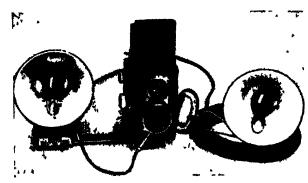

Test Light Keeps You From Missing Flash Pictures — Kalart is the only B-C flash equipment with built in test light You piess down on test light ofter inserting flash lamp Flash of test light means firing system is O K flash lamp is O K Automatically tests every lamp in extension flash hook-up.

Right Kalart B C Flash Unit (Model BCZ) with bracket to fit accessory shoe on Zerss Agfa, Voigtlander and other imported cameras with built in sync. \$14.30

Below Kalart B (Speed Flash with Automatic Synchronizer (Model BCAS) Illustrated is the rubber cushioned attaching bracket for mounting to tripod socket of most cameras. Shown with one Series-Wired Lytension Unit ready for two lamp multiflash.

KODAK SELECTOL DEVELOPER

Whenever you use papers of inherent warmth such as Kodak Opal or Kodak Platino, be sure you develop them in Kodak Selectol Developer. It provides an even rate of development, holds image colors uniformly, speeds print production. Selectol is an excellent developer for prints to be toned. Easily mixed by adding water, a gallon of 1:1 dilution keeps about 36 hours in an open tray ... develops about 80 8 x 10-inch prints. Kodak Selectol Developer comes in ½-gallon, 1-gallon, and 5-gallon sizes.

KODAK MICRODOL DEVELOPER

Especially good for developing negatives from which many-diameter enlargements are to be made. Kodak Microdol Developer is also excellent for all roll films, film packs, sheets, and plates. It attains its low graininess with very little effect on the original emulsion speed. And development time is brief. Microdol comes in 16-oz., 1-qt., 1-gal., and 5-gal. sizes.

KODAK RAPID LIQUID FIXER (with hardener)

Here is a versatile fixer... one you can use with either films or papers. Kodak Rapid Liquid Fixer requires only dilution with water. With it you can fix and harden films and plates completely in 3 to 5 minutes. Start using this fast-acting fixer soon. You'll save time and trouble... get each job done faster... and better.

Kodak Rapid Liquid Fixer (with hardener) comes in bottles for making one and five gallons of solution, and 6½-gallon carboys to make 24 gallons of solution for films, double this amount of solution for papers.

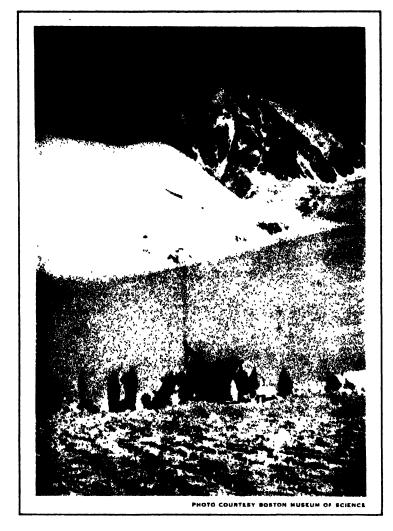

For the complete line of Kodak chemicals, see your Kodak dealer.

EASTMAN KODAK COMPANY Rochester 4, N. Y.

MARCH 1952

BRADFORD WASHBURN EXPLORES MCKINLEY

WITH HIS POLAROID LAND CAMERA

Washburn used a Polaroid Yellow Filter with shutter set at #5 to get this brilliant result from new Type 41 Polatoid black and-white film. The day was cold and bright—an equivalent background reading of Weston 800 1000

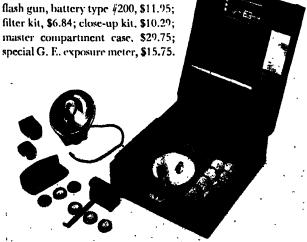

Bradford Washburn's pictures have made McKinley one of the world's best-photographed mountains. On this year's ascent, he took a Polaroid Camera to record a new route up the 20,270-foot Alaskan peak.

According to Washburn, the Polaroid picture-in-aminute Camera was "indispensable to the success of our high-altitude survey work, enabling the survey party to identify twice as many control points as ever before." And it operated perfectly under tough conditions.

You don't have to be an explorer to share in the exciting adventure of picture-in-a-minute photography. It's so simple to achieve new effects, to get better results, to open a whole new world of picture possibilities, when you can check your work right on the spot! and get the added thrill of seeing your pictures as you take them. Polaroid prints make fine enlargements, too. Extra copies and negatives are easy -- and inexpensive.

Whether you're an old hand or a beginner, ask your photo dealer for a demonstration of the Polaroid Land Camera. You'll wonder why you ever waited.

POLAROID ACCESSORIES:

FOR FREE BOOKLET, "38 Ways to Make the Most of 60-Second Photography," write Polaroid Corporation, Department PS-4, Cambridge 39, Mass.

POLAROID Land CAMERA

The world's most exciting camera

Get Extra Brilliance with BRILLIANT

Indiatone Paper's Sparkling New Surface!

Ask for

AnscoINDIATONE BRILLIANT "It's brilliant, PLUS," you'll say, when you see your first prints on this new Indiatone paper. Known officially as Indiatone "B" double weight, there never has been a textured paper like it for bringing luminous sparkle to enlargements for getting so much brilliance in a print!

Be sure to try Indiatone Brilliant the next time you make enlargements of any full scale subject that would benefit by the extra brilliance of this amazing fine-textured exhibition surface!

Brilliant, of course, is coated with the improved Indiatone emulsion, noted for its rich gradation and extreme exposuredevelopment latitude. No other paper can match Indiatone's gratifying response to developing and toning manipulations including easily used Ansco Liquid Flemish Toner to produce prints of rich distinction. Put new sparkle in your brightest pictures by enlarging them on Brilliant!

ANSCO, BINGHAMTON, N. Y. A DIVISION OF GENERAL ANILINE & FILM CORPORATION. "FROM RESUARCH TO RESULTY."

CONTAX II-A

A real achievement in camera design — a camera that challenges comparison.

Fast and simple in operation. All speeds are controlled by one dial — and all controls are on top at your fingertips. You can operate it with one hand.

Unsurpassed Zeiss Opton lenses in light-weight bayonet mounts. Rapidly interchangeable. No screwing. Precision seating.

Durable all-metal shutter remains reliable in all climates. Never becomes sticky.

The base of its range-finder is one solid prism, insuring permanent accuracy. One window for range-finder and view-finder permits rapid focusing and framing of picture.

Lenses and Contax accessories now available give this superior camera unlimited scope.

HONORARY PRESIDENT

Louis F. Bucher, Hon.PSA

OFFICERS FOR 1951-1953

BOARD OF DIRECTORS

JOHN G. MULDER, HON PSA, FPSA,
Rochester, N. Y.
HARRY R. REICH, APSA ... N. Tonawanda, N. Y.
FRANK E. RICH, APSA ... Chicago, Ill.
C. C. RUCHHOFT, APSA ... Cincinnati, Obio
ARNOLD V. STUBENRAUCH, APSA, Philadelphia, Pa.
WILLIAM F. SWANN, APSA ... Rochester, N. Y.
MISS DORIS M. WEBER, APSA ... Cleveland, Ohio
MISS VERA B. WILSON ... Rochester, N. Y.
PAUL J. WOLF, APSA ... Hawthorne, N. Y.
S. P. WRIGHT, APSA ... Springfield, Ill.
HARRY YOURAN ... New York, N. Y.

THE PRESIDENT REPORTS . . .

Things happen! As this is written, the "Tops" show has appeared in Montgomery, Alabama, and Memphis, Tennessee, and about 1,400 PSA'ers and their friends have had an opportunity to see an outstandin, group of prints, valuable and interesting movies, and an unusually good set of slides. The Montgomery audience was most enthusiastic, as I saw it, and enjoyed both the show and the interesting talk by Cortlandt Luce, APSA, who came from Atlanta to speak. The same applies to the excellent talk by Dr. Clinton Baker of the Memphis CC and the general reaction in Memphis to the whole show. To my regret, I could not get to Memphis, but the reports are fine.

Perhaps the most interesting thing in these first "Tops" exhibitions is the keen desire to see PSA stage more important events like field trips, National Lecture Programs, and other photographic affairs of such scope as to attract the attention of the whole community. It may well happen that "Tops" will start the ball rolling for the general program of PSA local activities all over the country. Paul Wolf of the "Tops" Committee and Eugenia Buxton and Jack Jones of the local committees deserve full credit and praise.

Something New Will Be Added

An important part of our photography and therefore of PSA JOURNAL is the personal contact between PSA members all over the country. As an aid to that close contact, a new page is planned in the JOURNAL as one of the many new features that will appear as fast as the Editor and the Publications Committee can work them out and get them started.

The new page (it may be only a column at first) will consist of the shortest possible personal items of the news of PSA'ers without regard for geography. Division affiliation, previous importance in the Society, or any other measurement of the importance of the news. The items, photographic or otherwise, will be printed

in the order in which they come to the column editor's attention and will result, we hope, in everyone's knowing everything almost about every other PSA'er.

Send every item you would like to see in the new Jot RNAL page (it will have a name someday) to Miss Vera Wilson, 343 State St., Rochester 4, New York, and send it as soon as possible so that you won't forget it. She will pick out those which may be the basis of releases from her Public Relations and Publicity Committee and then turn all of the material over to the editor she appoints. The success of this new venture -as of all that PSA does—depends on you

The Convention

Plans for the coming Convention are expanding amazingly. Several of the Division committees have completed their programs and the general, inter-division activities are well along. Paul Gibbs and his faithful committee chairmen-in addition to contributing heavily to the paper shortageare neck-deep in the hundreds of details and expect to make definite announcements in the very near future. As a result of a letter Paul sent to PSA members in the area, scores of letters have come in volunteering help in the convention duties, and since the August date was announced, scores more have greeted a "vacation period" convention gleefully. It seems that PSA'ers all over the country are looking forward to joining the hundreds of thousands who visit New York each summer and find it one of America's most photogenic --- and most photographed ---

Present plans include a number of tours to the famous areas under the guidance of the photographers whose names you know as having specialized in them. Several such "escorted" trips are planned both before and after the actual convention meetings. Some of them will be of "the behind the scenes" kind which will enable PSA'ers to shoot things usually forbidden. See you in August.

Norris Harkness

NEW AIDS FOR BETTER PICTURE-MAKING

By Jacob Deschin, APSA

IF YOU OWN a 16mm movie camera and a projector you can get stereo movies, simply by attaching a special device for this purpose. The switch from straight movies to stereo is made possible by the Nord 3rd Dimension Converter, just being introduced by the makers, The Nord Company, 254 First Avenue North, Minneapolis, Minn One attachment goes on the camera for taking stereo movies, another goes on the projector for showing the results. The whole business, including a special stereo screen and the Polaroid glasses needed to view the projected stereo movies, costs \$83.50 plus tax. The Nord system is designed to convert any 16mm camera into a stereo movie camera by simple attachment without altering the camera itself.

The precision optical device, which may be mounted on the camera or dismounted quickly, is operated normally except that viewing is from waist level on a reflex screen. In some respects, the device is similar to the Stereotach attachment used on still cameras to produce stereo pictures. The device cuts out some light, necessitating an increase in exposure of about two-thirds of a stop above normal. Projection of the results also remains practically unaltered. The projection unit, which resembles the camera converter, is placed in front of the projection machine, and the light beam passing through it is directed toward a special stereo screen, where it is viewed with Polaroid glasses, several pairs of which are supplied with the outfit.

The distance of the screen from the projector must be somewhat farther than in ordinary screening. Also, it is imperative that the picture fill the entire screen surface; if this precaution is not observed, secondary ghost images will appear at the sides of the stereo picture. Another limitation of the Nord is that the shape of the picture is vertical instead of the familiar horizontal, but this difference generally escapes notice, being counterbalanced by the new movie sensation of stereo depth.

The projected results are reported to be free of blur or flicker and to give a satisfactory illusion of three dimensions as if the screen had disappeared and in its place a window had opened on the original view. The screen supplied is rather small, but the manufacturer says that larger screens are also available.

Other news in the movie field include the announcement by Radiant Manufacturing Co., 2627 W. Roosevelt Road, Chicago 8, of the Radiant Classroom Screen. It is equipped with hinged side doors or "blinkers" to permit movie and slide projection in lighted rooms. The doors protect the screen surface when not in use. A tilting chain at the top of the screen is provided for adjusting the viewing angle. The 20x20-inch size is \$29.75; 30x40-inch, \$37.75, and 40x40-inch, \$39.75.

Protecto Film, a motion picture film protector and preserving fluid that has been used professionally for more than 18 years by the manufacturer, Standard Film Processing Co., 723 Seventh Ave., New York 19, is now being packaged for amateur moviemakers. Protecto is said to preserve, protect, clean and prevent normal scratches and brittleness of color and blackand-white motion picture film and slides. A six-ounce bottle is \$1.50.

In still cameras, the news is that the Kling Photo Supply Corp., 235 Fourth Ave., New York 3, has just imported two new Balda folding cameras, which are made by the Balda Works in Western Germany. The cameras are the Baldalux 120, which uses 120 film to take eight 2½x3¾-inch pictures to the roll, sixteen half this size when a mask is inserted; and the Baldinette 35mm camera for miniature film. Each costs \$49.95 and has the built-in M-F-X Prontor SV shutter to accommodate all flash lamps at all speeds, with built-in self-timer and speeds from one second to 1 300th.

The Baldalux also has a body release; double exposure prevention; two finders, telescopic optical and reflex; two tripod sockets for vertical and horizontal shots, and is equipped with the coated 4-inch f./4.5 Radionar lens. A deluxe leather eveready case is \$6.50.

The Baldinette, a compact, light-weight camera the size of two packages of cigarettes, has double exposure prevention; automatic film stop and film counter; built-in telescopic finder; body shutter release; accessory clip on top of the camera; depth-of-field table and 2-inch f/3.5 Radionar. A deluxe case is \$7.95.

Those who have been looking forward to getting that new 2½x3½ Linhof Super Technika are in for a temporary disappointment. A \$35,000 shipment of these deluxe jobs went down with the Flying Enterprise, according to word from Paul Klingenstein, president of Kling Photo Supply Corp., who adds that "arrangements are being made for a replacement shipment" and that it is hoped a new shipment will come in soon.

On the heels of a recent announcement that new view finders are being supplied for Kodak's Tourist cameras comes word that a new shutter, twice as fast as the old one, is being installed on the Kodak Tourist II camera, the one with the Kodak Anaston 105mm f/6.3 lens. The improved shutter is the Kodak Flash 200, which replaces the 1/100 Kodak Flash Diomatic Shutter formerly supplied. The new shutter, of the cocking type, with rim-setting speed ring, has speeds of 1/25th, 1/50th, 1/100th and 1/200th of a second plus bulb.

TAKE WHAT YOU SEE... THEN SEE EXACTLY WHAT YOU TAKE

W HAT do you look for in a camera? If it's pictures just short of Nature herself, get a Stereo-Realist. For pictures you'll be proud to show your friends . . . for deep-down personal photographic satisfaction . . . for lasting pleasure . . . Realist is the camera for you. Expert or novice, your first roll of Realist pictures will thrill and amaze you with true-to-life realism and beautiful, natural color.

REALIST pictures are so real they almost live and breathe. For the REALIST is the one fine camera that duplicates each scene just as you see it with your own two eyes — in breath-taking third dimension. That's why it rates top place with people who know picture-taking and picture-making.

Actually, it's impossible to describe the astounding beauty of REALIST pictures. If you haven't had the thrill of seeing REALIST pictures, visit your camera dealer. He'll be glad to show some to you. For his name and a copy of the REALIST catalog write: DAVID WHITE COMPANY, 387 West Court Street, Milwaukee 12, Wisconsin.

STEREO Realist

THE CAMERA THAT SEES THE SAME AS YOU

Steren-REALIST Cameras, Viewers, Projectors and Accessories are products of the David White Co., Milwankee 12, Wisconsin.

BUY THESE CUSTOM-BUILT REALIST ACCESSORIES AT YOUR CAMERA DEALER

Filter Kit

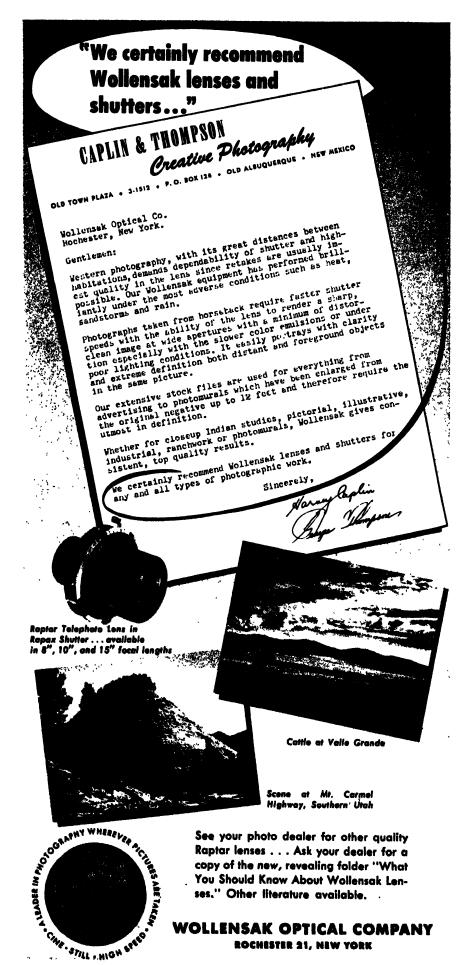

Matched pairs of Type A conversion, haze and flash filters. Absolutely parallel and without prism for perfect stereo work. Billfold-size case is top-grain saddle leather.

Viewer Transformer Provides steady, even source of illumination equal to fresh batteries. Shockproof metal case; 12-foot cord.

Shoulder Bag Top-grade saddle leather, compartmented for REALIST camera accessories. Choice of color.

It is synchronized for Class F lamps up to 1/100th and for Class M lamps at 1/25th. The lens has click stops for the diaphragm settings of f/6.3, f/8, f/11, f/16, f/22 and f/32.

A new sheet film holder, the Riteway, for Graphic and other press-type cameras, is being offered by Graflex, Inc. Core of the new holder is an extremely flat aluminum backbone to which the metal film septums are bonded; the core is then bonded into a thermoplastic frame, forming a one-piece unit. The Riteway has the Graflex spring-fingered light trap, new patented light-trap rails, and non-static dark slides. The new \$4.05 holder, which at present is available only for 4x5 film, has newly designed loading tabs, two erasable caption tabs on each side, and recesses for transparent negative identifiers.

Two new lenses for the Exakta camera have been placed on the market by Exakta Camera Company, 46 West Twenty-ninth St., New York, the American agency—a telephoto and a wide-angle. The telephoto is the Angenieux 135mm f 3.5, which gives an image three times that of the standard lens, has stops from f/3.5 to f 32, an engraved depth-of-field scale, and costs \$75.50. The wide-angle is the Steinheil Cassaron 40mm f 3.5, which covers a viewing angle of 57 degrees and is priced at \$49.50.

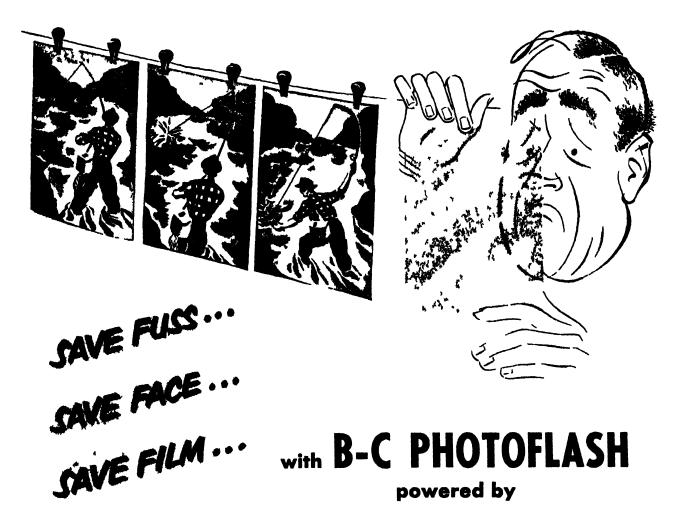

New lens attachments for the new 8mm Revere Fifty camera with the 12.7mm f 2.8 Revar lens and the Stereo Realist camera, have been made available by Enteco Industries, Inc., 610 Kosciusko St., Brooklyn 21, N. V. For the movie camera there is an adapter ring of the slip-on type, costing \$1.15 and a lens hood at \$1.75. For the stereo camera, the company has a set of two combination lens hoods and filter holders at \$4.50 per set. The company says that the latter has a unique slotting design that permits an accurate snap-on fit. Write them for literature.

The Annular Lamp, for closeup (macro-) photography, is offered by Heitz and Lightburn, 150 West 54th St., New York 19, distributors of the Alpa-Reflex and Alpa-Prisma-Reflex Swiss 35mm cameras. Consisting of a ring of small electric bulbs that can be placed around any camera lens to provide flat, shadowless illumination, the Annular Lamp has a special rheostat for controlling the light from dim to full illumination, permitting a wide range of lighting to fit various needs. The \$55 lamp includes a circular opaque plate on top of the lamp and a concave Alpa mirror under it for rear illumination of small objects, a particularly valuable feature for scientific photography.

Owners of the G. E. Mascot meter may now protect their little treasure with a \$1.75 all-leather, eveready case, thanks to Service Manufacturing Co., Inc., 120 East 16th St., New York 3. The case is made of redwine bridle cowhide, suede-lined, saddle-stitched and has an enclose that swings around out of the way when taking readings.

You can mount two prints back to back or see both sides of a print (the backside for notations, for example) in a new photo album and photo protectors introduced by

PSA JOURNAL, Vol. 18, Mar. 1952

with B-C PHOTOFLASH powered by

"EVEREADY" "B" BATTERIES

EVIR felt sad about the shot that got away? Of course you have if you depend on conventional flashlight batteries in your flashgun. Maybe it was the baby's cutest smile or an on the spot news shot you lost. No matter what the subject it was darned annoying cost you something in film and working time too

With the Battery Capacitor System of photoflash firing powered by IVIRIADY Battery No 412 especially designed for this ser vice you can absolutely eliminate irregular synchronization and w isted film exposure due to battery failure. One tiny IVFRFADY B BATTFRY in your B C Unit will fire up to 20 000 bulbs within

the long shelf life of the battery, and assure positive sync even with multiple flash work. Battery replacements are reduced to once or twice a year

Save fuss, save face and save film with BC Photoflash and FVERFADY Photoflash Batterics!

No more undependable flash bulbs. No more valuable dollars thrown away. Your initial cost is your only cost. The CELLUX SM2 is the lightest weight portable on the quality market. Features the G.E. FT-110 tube with 75 watt seconds output. Film Guide No. 160 with Super Panchro-Press Type B film. Battery charger and handy slave unit also available. See your dealer today or write direct for complete details.

the Kirk Plastic Co., of Los Angeles. The protector has plastic pockets made of Kodapak sheets, is topped with a gummed strip that attaches quickly to a photo album page without glue. It may be had in popular print sizes for 50 and 70 cents a dozen, depending on the size. The new album, in one size only, 634x912 inches, is adjustable for varying numbers of pages and different print sizes. The album is so designed that prints can be removed from the pockets at any time. The album costs \$6.50. Incidentally, the photo protectors may also be obtained in extra-large sizes to accommodate 5x7 or 8x10-inch prints.

Du Pont has just published an 85-page booklet, "Du Pont Photographic Films" at 35 cents. Intended primarily for users of sheet films, the booklet contains in addition to detailed information on the working characteristics, uses, exposure and processing of the various Du Pont films, a general discussion of modern photographic methods and techniques, including picture-making, lighting and exposure. Other chapters explain film sensitometry and offer guidance in choosing film for various purposes. There is also a formula section for various working solutions and a 28-volume bibliography.

And have you heard about the "Talking Letters" program, sponsored by Revere Camera Co. and Minnesota Mining & Mfg. Co.? Free 100-foot reels of Scotch recording tape in self-mailing cartons enable the folks at home to send actual messages to servicemen and women and to hear their voices when returned. At all dealers.

A PHOTOGRAPHIC HOLIDAY

The PSA New York Convention, August 12th-16th

JACK A. GOLDSACK

Just name it and New York's got it, in abundance. America's most photogenic city beckons with its miles of waterfront and the world's greatest piers. The world's tallest and most modern buildings with some of America's historic structures right in their very shadows. Mammoth bridges, tunnels and the largest network of transportation arteries to take you everywhere in measured minutes. A melting pot second to none including people of all races, picturesque streets, market places, and to please the little woman, the finest shops in the very heart of the nation's greatest style center. These are but a few of the many attractions which await you.

It is difficult to avoid the use of superlatives in any reference to this great city. The vast array of material on which to focus your attention and your camera is enough to stagger the imagination. You may choose as your viewpoint the top of the world's tallest structure, just 3 blocks away from your hotel, the huge New Yorker. Or the quaint and quiet crooked streets of Greenwich Village. Or the fabulous Radio City. Or Times Square at night, so brilliant as to permit fast exposures at small apertures.

Yes, just name it and no matter what kind of city material suits your fancy, IT'S HERE . . . and more of it. And for the first time in PSA history it's all yours as part of your summer vacation. For the dates of our New York PSA Convention this year, August 12th thru the 16th, have been set with you in mind, and to enable more PSA members to attend. Many will be coming to their first PSA Convention because of this opportunity. And this is one convention which has been planned to include the entire family for New York offers fun for all.

Arrangements are now nearing completion to offer ample photographic and social activities for those convention visitors who come early and stay late. So you need not limit your plans to merely the five jam-packed, scheduled, convention days. All of these activities, before, during and after the convention will be under the able guidance of men and women with a sympathetic understanding of your needs. Every photographic, social and even domestic contingency will be provided for, including baby sitters at the hotel, so you take in not only the daytime events but the night spots and theatres for which New York is famous.

Without question, New York in summer is a picture paradise. The weather is mild. U. S. official Weather Bureau says the average mean temperature is 74° That's good and sufficient reason why New York attracts between 3,000,000 and 4,000-000 out of town visitors each summer, many of them loaded down with photographic gear. It's America's largest summer resort, offering comfortable shooting

weather with plenty of sunshine. Besides, to make certain of your complete comfort, all the vast banquet halls, parlors and exhibit rooms of the New Yorker, largest hotel in Manhattan, are completely air-conditioned.

Although the informative and stimulating convention activities, with so many "firsts" this year, should be enough to bring you to New York, the added advantages which this great city affords combine to make this an ideal vacation for the entire family. No need to concern yourself over what to do with the family while you take in the convention highlights. The little woman will spend many pleasant hours window shopping along famous 5th Avenue. For the youngsters there are museums, zoos, beaches and the varied carnival amusements afforded by Coney Island and other similar spots. The vastness of these places in New York and the variety are ample to fill in weeks of a New York vacation.

You will read a good deal more about the actual convention program in subsequent issues of the JOURNAL. But here are just a few of the convention highlights and activities planned.

- 1. Five full days of activities instead of the usual three or four.
- 2. Other events planned for those who come early and stay late.
- 3. Additional sessions devoted to specialized phases of photography are being projected. Among them a symposium on photography in biology and medicine, photography in science and industry and others.
- 4. ALL Convention activities will be housed under one roof, INCLUDING THE EXHIBITS.
- Exhibitions this year will encompass more phases of photography, including stereo.
- Pre-convention and post-convention field trips will give everyone an opportunity to unlimber cameras on photogenic New York and surroundings.
- 7. A monster and gala informal welcoming and get-acquainted Jamboree is scheduled for the first convention evening, August 12th. This event will include celebrities of the stage, screen, television, public affairs and photography.
- 8. A boat tour of New York harbor with special emphasis on its photographic possibilities.
- Other tours are planned thru studios and laboratories of internationally famous photographers as well as the great picture magazines, news picture services and newspapers.

Make your plans now to join us for a veritable photographic holiday. Bring the family. But get your reservations in early. Remember, there will be MORE PHOTO FUN FOR YOU IN '52 AT THE NEW YORK PSA CONVENTION. Don't miss it!

Camera Club Manual

H. J. Johnson, FPSA

Chapter III

Camera Club Meetings

Meetings, essential to camera club existence, simultaneously provide the means whereby members may improve their photographic talents, the social ties which bind members to the organization, and the friendly association enlivening the enjoyment of a sociable hobby. While not the only activities of the camera club, meetings are so important as to merit major consideration, planning, and effort.

Since camera club welfare depends primarily upon keeping members (1) interested, (2) active, and (3) making progress in photography, meetings should be so planned and conducted as to be (a) interesting, (b) constructive, and (c) enjoyable.

Interesting meetings maintain member enthusiasm and attract guests, the only possible source of club growth. Constructive meetings assure members that they are benefiting by club affiliation and growing in photographic knowledge and stature. Enjoyable meetings contribute to the highly important social atmosphere of the club, and serve properly to make photography an avocation affording pleasant relaxation.

Planning Meetings-

Interesting, constructive and enjoyable meetings result from plan rather than happenstance, from leadership rather than circumstance, and from purpose rather than luck. The success of meetings rests with club officers capable of planning, conducting, and directing meetings in such a way that members find enjoyment and benefit.

In many respects, camera club meetings are theatrical enterprises. Their purpose primarily is to interest, to inform, and to entertain. Consequently, the planning and conduct of meetings may contain elements of (a) the new and novel- to arouse interest; (b) the educational to benefit the members; and (c) entertainment-- for greater sociability and enjoyment.

Each meeting can present something new and different, with the result that members will be looking forward to attending future meetings as a pleasurable experience. not merely as a club duty. Each meeting can present something serious and beneficial in photography, both to carry out one of the primary purposes of the club and to improve the mass photographic talent of the membership. Each meeting can contribute to pleasure, enjoyment, and sociability, for purposes of making the affair more interesting, to prevent the organization from becoming too intense, from taking itself too seriously, and for relaxation.

The planning of meetings may be the responsibility of a Program Committee, if the club is large, or of a Program Chairman, if the organization be limited in mem-

bership. The size of the club, the interests of the members, and the scope of its overall program are governing factors.

Meeting plans should be made and completed before the club opens its active season, and so be prepared as to assure proper correlation with other club activities. Thus a lecture on portraiture logically may precede a club project on portraiture.

While the preparation of plans for meetings may be the responsibility of the Program Committee, or Program Chairman, the cooperation of other officers and of committees, and even of the whole membership must be invited. No club officer or committee can hope to have a monopoly on good meeting programs or ideas. Furthermore, inviting members to make suggestions for meeting programs serves many good purposes, among them increased membership participation in club affairs and greater assurance of holding the kind of meetings the members prefer.

Program Survey -

Photography is so comprehensive that meeting programs may be developed virtually in endless variety and unlimited interest. Programs of American camera clubs are about equally divided between lectures and other features. In general, the greater proportion of club meetings is planned by Program Committees, a lesser proportion by Program Chairmen, and a few by vote of the club membership. Many clubs utilize club talent regularly on meeting programs; others feature club talent occasionally. About one-third of the clubs depend upon outside speakers. The greater proportion of club membership prefers to hear outside speakers when, as, and if available.

Preparation of meeting programs will be governed by many factors, including (1) interests of the members, (2) size of the club, (3) availability of talent, and (4) capability of the planners.

Interests of the members are of primary importance. They give reliable indications of the nature of plans to be made for the meetings. Meetings must interest members to be successful.

The size of the club is a factor influencing the preparation of meeting programs only in degree. Members of a small club may have astounding breadth of photographic interest. Availability of talent, on the other hand, is a problem seriously influencing meeting programs, and demanding the extreme of resourcefulness, alertness, and leadership on the part of the Program Committee or Program Chairman. Talent may be sought, and found surprisingly often, within the membership.

Essential to successful meeting programs are variety, novelty, and continuity. Variety makes for member interest, prevents programs from getting into a rut, and

promotes the progress of members in photography. Novelty contributes elements of surprise and alertness. Both are essential to successful programs. Continuity contributes to the photographic progress of members by tending to lead them to greater and better effort through natural and logical steps.

Variety Helps

Variety calls for sufficient difference in meeting programs to keep alive member interest, but not necessarily to range the full gamut of photographic subjects. For instance, talks on portraiture at successive meetings by a professional, an amateur, and a specialist, such as a children's photographer, would provide an interesting and helpful variety of information on the same subject. A subsequent meeting at which members were given opportunity to pose and to photograph each other well might end a series of programs offering varied treatment of the same general subject, with definite benefits to members.

In fact, some clubs may find it the wish of their members to study and practice one phase of photography throughout all, or part of, a season. In such case, varied approaches to the single subject are essential.

Novelty offers the intriguing element of surprise. Club members who never are certain just what is going to happen at a meeting, but have confidence the meeting will be interesting, informative, and enjoyable, naturally will be anxious to attend. Those who have been led by experience to expect nothing new or different become loath to attend. Possibilities of introducing novelty into club meeting programs are numerous. A "masked speaker," a reversal of the customary meeting procedure, a short photographic skit, a sudden change in the program—all have elements of novelty, surprise, interest. Of such small things—the unusual—is showmanship comprised.

Continuity in meeting programs can result only from planning for the season on the basis of the announced interest of the membership. Frequently, it is possible for club officers to ascertain in what phases of photography the membership really needs training, and to plan the program accordingly.

The average camera club, located in a city reasonably rich in photographic talent, might decide, after ascertaining the interests of the members, to develop a schedule which would concentrate on making pictures for exhibitions. The season's program could look like this:

First meeting: Informal talk explanatory of exhibitions, with exhibition of prints or slides accepted in representative shows. Subject: "Crashing the Shows."

Second meeting: Informal talk explanatory of the types and kinds of pictures accepted by exhibitions. Subject: "Pleasing the Judges."

Third meeting: Informal talk on developing ability to see p'ctures, in nature and in the negative or proof, and to create pictures. Subject: "Seeing the Picture."

Fourth meeting: Informal talk on control processes, such as chalking, paper negative, mediobrom, and others. Or on color correction of slides. Subject: "Artistry and Control."

Fifth meeting: Field trip for study and taking of pictorial shots. Sixth meeting: Informal talk, with demonstration on preparing, mounting, and sending prints or slides to exhibitions; discussion of the ethics and sportsmanship of exhibiting.

The responsibilities of the Program Committee for the success of the club's meeting season, and in no small degree for the successful operation of the club itself, obviously are heavy and continuous. These responsibilities, by their nature, require that the Program Chairman, and the members of the Program Committee, be persons of organization experience, vision, wide acquaintance with photographers, capacity for advance planning, dependability, and resourcefulness. That they must also be self-sacrificing, particularly of their own time and talents, goes without saying.

Audience Participation Program --

A type of club meeting which is extremely profitable to members, and which is too rarely used, is that in which the audience, under the guidance of an experienced critic, analyzes a set of slides or prints.

The value of this type of program is that it calls for a "recitation" by each member, with the "teacher" correcting, suggesting, and "pointing out." Thus the member obtains experience in public criticism and, if he is qualified, may then go on to become a "critic" in his own right.

The leader, or director, must be one whose qualifications are respected by the members, and who has the ability to get members to participate, to speed them or encourage them when they grope, to furnish "leads" concerning merits or flaws in the picture, and to keep things moving at a pace smooth enough so that each picture receives an evaluation as effective as if the criticism were being done by one expert.

Members may bring in their own prints or slides for a meeting of this type, or a set may be obtained from the PSA or another club.

The procedure is somewhat as follows:

The first print is placed on the easel, or a slide is projected. The director gives a partial criticism and then selects a member at random to complete the criticism, guiding him so that he does not attach too much importance to trifles, that he finds the points to be discussed, that he does not become too vague and "wordy", etc. After he is finished, the director summarizes the points for the print or slide. Occasionally, he may ask for an audience vote as to whether certain pictures would have chances of success in major exhibitions.

Each member should be given at least one chance on the floor, and this calls for a good memory and good organizing ability on the part of the director. The random selection is important because it induces each member to concentrate his attention on the picture in an effort to get some of his thoughts organized in case he should be called upon for his opinions.

Conducting Meetings-

Nothing contributes more to member enthusiasm for the camera club and to the club's own reputation than well-conducted meetings which are orderly, swift moving, interesting, and enjoyable. No specifications can be written for the different kinds of meetings which different clubs prefer. That meeting most is enjoyed which (1) annoys the members least with club business, (2) proceeds rapidly to the main feature of the program, (3) gives the members their fill without surfeit of the subject, and (4) closes in an atmosphere of friendly satisfaction and enjoyment.

Such meetings may be obtained by planning so as to avoid the dangers of:

- 1. Delay in starting.
- 2. Prolonged and argumentative discussions of club business.
- 3. Trite subjects and dull speakers.
- 4. Nonchalant and disinterested presiding
- 5. Dragging procedure.
- 6. Ignoring the wishes and interests of members,

Of these, delay in starting is the most irritating to members beyond the "inner circle" and usually represents a chairman lacking in decisiveness and determination. Slovenliness in getting a meeting under way inevitably will result in loss of members and decrease in attendance.

Proper selection of subjects and speakers assures club members of an enjoyable evening. Speakers should be informed in advance of club practices and traditions. The same opportunity may be grasped to suggest to the speaker how best he may achieve his desire to obtain popularity with the members. This is a diplomatic way of leading him to avoid his own shortcomings, such as a tendency to talk too long.

Presiding officers, if alert and observing, will keep meeting procedures lively, entertaining, friendly. By resourcefulness and planning, they avoid lulls, dull spots, and dragging periods in the program. By using tact and humor, they establish the tone of the meeting.

The club which plans a two-hour meeting may arrange the schedule along these lines:

- 1. Meeting convenes (8 PM sharp)
- 2. Business announcements and reports (8:00-8:15).
- 3. Introductions of guests (8:15 8:20).
- 4. Introduction of speaker (8:20 8:22).
- Speaker (30 or 40 minutes; no more unless audience indicates strong desire for speaker to continue).
- 6. Discussion, questions, and answers (9:10-9-25).
- 7. Intermission (9:25 9:30).
- 8. Contest judging (9:30 10).
- 9. Adjournment at 10 PM.

Variety may be introduced into club programs, among other ways, by changing the order of procedure. At some meetings, the judging may be the feature, and consequently be given more time than the speaker. At other meetings, discussion and questions and answers may be given the longer time.

Important to enjoyment of club meetings, and to club health and growth, and contributing also to variety, is courteous and friendly reception of guests. A Reception Committee, or Chairman, properly may meet guests at the door, obtain their names and addresses so that future meeting notices may be mailed to them, and then introduce them to the officers and members of the club. In this way members have opportunity to decide whether the club may invite guests to become members.

Obligations to Speakers--

Important to club reputation, and especially to the facility with which it obtains speakers, is courteous treatment of speakers.

No speaker should receive less than his expenses, and these are defined as transportation and dinner. There are two ways to handle this. One of the club members may call for the speaker at his home or office, take him to dinner (at which some of the officers or other members may be present) and return him home after the meeting. Or if this is inconvenient for the speaker, and he prefers to come to the meeting "on his own" (because of other engagements, perhaps) he should receive the equivalent of his expenses either in a lump sum or in the form of some gift equivalent to the expenses.

No club is entitled to feel generous because it merely pays its speaker's expenses. This is the absolute minimum for self-respect; it includes nothing at all for the speaker's own personal time, which averages about four hours per engagement, portal to portal. (In many cases the speaker even may have spent the preceding evening preparing his lecture.)

Speakers should be made to feel welcome, courteously introduced, aided in the presentation of their talks, and protected from "cranks", arguments, and other incipient embarrassments. The club's appreciation of their efforts thereafter should be expressed, personally and by mail.

Sociability Essential -

While indirectly related to conduct of meetings, yet a feature thereof, the promotion of social life in, and of, the club is essential. Members may dine together before the meeting. Members may assemble informally after the meeting for refreshments and discussion. So far as possible, the speaker and guests should be included in these informal get-togethers. Particularly on field trips, members should be encouraged to work together and to enjoy each other's company. The results are club friendships, and a club spirit of friendliness and fellowship, which pay dividends in membership cooperation and success. To neglect these social opportunities is to risk the danger of sour, over-serious, suspicious competition between members and a lack of solidarity which may threaten the club's very existence.

Contributory to club social life are membership badges for members, officers, and guests. The badges, worn only at meetings, should be sufficiently large to show the name of the wearer. Badges may be in different colors or shapes, so as to distinguish guests, who then may be the more readily welcomed by members, and to identify officers. Names on the badges are helpful in promoting closer acquaintanceships between members, since identification without asking eliminates embarrassing barriers to conversation and friendship. The badges may be kept by the club secretary for distribution at the door before the meeting opens and for collection from wearers as they leave

Badges need not be complicated nor expensive. They can be fashioned from stock, price, or shipping tags available at stationery stores.

(To Be Continued)

Get a trout fisherman to cooperate on a "running gag" for your film on a recreational subject.

HARRIS B. TUTTLE, FPSA

How to Use

THERE ARE many devices that can be used in motion picture photography to increase picture interest and often to add humor to a film which might otherwise be uninteresting to a general audience.

One of the easiest devices for any movie maker to use is the "running gag." This consists chiefly of a simple situation which is repeated several times during the film.

While running gags can be used in some form or other in any picture, they seem to fit in and do more for travel films than any other type.

For example, in making a vacation travel film during a trip to Mexico, one might come upon a scene where a peon has stopped beside the road to rest his donkey which is hitched to a two-wheel cart; the peon is having difficulty trying to get the donkey to start again here is a chance for a "running gag" shot. Tip the peon a peso or so and then take your movie camera and expose several shots of his efforts to get the donkey moving again.

Perhaps it would be more entertaining to break this footage down into five or six separate scenes of eight or nine feet each and film each scene from a different angle. The first scene could be of the peon shaking the lines so that they slap the donkey on the back and making every effort to make the donkey move, filmed from one side.

The second shot could be of the peon standing in front of the donkey, trying to pull him forward, filmed with the camera near the cart and looking toward the peon. The third of the peon back of the donkey pushing; this could be taken from in front of the donkey. The fourth of him fanning the donkey with his hat and then whispering in his ear, taken as a semi-closeup of the peon at the donkey's head. The fifth shot could show the peon holding up a handful of grass in front of the donkey trying to coax him forward, perhaps taken from the opposite side of the first shot.

If you are fortunate enough to come upon this situation at a time near sunset, make a shot of the peon pushing the donkey, silhouetted against the sunset sky. Perhaps an extra shot of the peon's efforts purposely underexposed about two stops could also be used. This would appear as though it were made during twilight.

Now, go on and make the rest of your travel film on Mexico. When you assemble the film, cut in these shots of the peon and donkey at suitable intervals. After a few shots of the Mexican countryside, insert the first scene of the donkey. Then, go on with the other travel scenes; then, after fifty feet or so, insert a title reading "In the Meantime;" then, back to the second shot of the donkey; then, on with some more travel scenes and so on till you have used all the donkey shots. It will not be necessary to use titles for subsequent scenes. Perhaps you will close your film with a beautiful sunset. What would be more appropriate than to follow what appears to be your last travel scene with the sunset shot of the peon and donkey or the underexposed shot which appears as though night

Seek out the potato bin at an army camp and you'll find a GI on a most appealing job—an excellent "running gag" shot for your film on army life.

A MOTION PICTURE ARTICLE

Running Gags

Find a tired donkey and a cooperative peon and you have the material for a "running gag" on old May-he-co.

were falling and the donkey still balked? Or, the film could be ended with a silhouette scene of the donkey finally moving and drawing the cart taken against the sunset sky.

It does not require much imagination to visualize the added interest and laughs this type of "gag" will add to an otherwise static-type of travel subject.

There are many variations of this type of gag. A scene of a peon sleeping in the sun with his big hat pulled down over his eyes. Twenty feet of this type of subject will suffice. As you travel all over Mexico, you come back every little while to check on Pedro and find he is still sleeping. If Pedro is a storekeeper and sells novelties, you may want to buy some picture postcards to mail home, and you can keep going back to the postoffice all through the film to try and buy postcards and each time find Pedro still sleeping.

A forty-foot scene length of a pair of wrestlers makes a good "running gag" shot for a film on school activities. With a fast lens you won't have any difficulty taking such a scene.

Here is another for a travel subject. In Florida or California, you may see a sign reading, "All the oranges you can eat for a dime." Shoot about five feet of film of the sign—then get a customer to plank down a dime and start eating oranges—get two or three bushels of orange peels, then start filming the customer with a small pile of skins in front of him, then increase the size for each of the five or six next shots. When you assemble your film, intercut these shots at proper intervals until the customer finally has all the oranges he can eat.

Another variation of a vacation film would be to use a scene of a dub golfer teeing-up, swinging and missing—get your golfer to repeat this scene five or six times. Then when editing insert the dub golfer swinging and missing at intervals.

In a simple film concerning activities around a farm, it could be shown early in the film that the farmer's wife, while feeding the chickens, decides to count them. There are 500 or more in the flock and they are all on the move. By shooting 15 to 20 feet of this scene, four or five 4-foot scenes can be used at intervals so that every so often the scene turns back to the wife counting her chickens.

Another good gag shot that can be used in a film on county fairs or amusement resorts is the "tired feet gag." In your film on the fair, show scenes of people walking—then medium close-ups of feet only-tired feet—then a half dozen shots of aching feet with bunions and high heels, etc. Finally, ending with the subject removing the shoes and walking barefoot, or a shot of the subject with both feet in a steaming footbath tub. A subject such as this is more difficult to do but can be very effective.

If you go camping, a good running gag could be added by showing one of the camping party opening a tin can of baked beans followed by a scene of him tossing the can next to the tent. Then make a series of shots of the pile of tin cans growing in size and height. One scene with eight or ten empty tins, then another of twenty or more, each scene should show a larger pile until it reaches almost the height of the tent. Other scenes can be made of the camp cook preparing a meal and each time opening a can of beans,

Then when the film of camping is edited the scenes of the cook opening cans and the pile of empties growing can be inserted at suitable intervals throughout the finished picture.

Another variation is to use a shot of a fellow pumping up a flat tire. Every fifty or hundred feet throughout a travel film, go back and see how he is progressing—each time show him pumping away on a hand pump without results. The first scene of the man pumping could be made at one frame per second speeded action—the next at 8 frames per second—the third shot at 16 or 24 frames per second, and the last shot at 64 frames per second. This would produce the effect that the man is tiring out and slowing up. This could be further amplified by having the first scene of a very fat man, the next of one slightly thinner, the third still thinner, and the last of a very skinny fellow. This would produce the effect of losing weight from pumping.

Another variation is a scene of a person filling up a container; for example, filling up a water trough from which animals are drinking or carrying water to the elephants at the circus.

One ingenious amateur made a film of his new baby and all the details associated with its care. At one place, early in the film, he showed pictures someone had made of him—shoveling diapers into the washing machine. Then, every little while he would flash back to a scene of him still shoveling diapers into the machine.

In making a film about a national park or some recreational region, early in the film it would be possible to film a man engaged in trout fishing. Make scenes of him casting a few times then wait until he gets a strike. Then have him cooperate by getting the fish up pretty near to his landing net then have him let it swim away. Have him repeat this action six or eight times before he finally lands the trout. These repeat shots can now be used as a running gag. Continue with your basic story about the park or region; however, when editing the film splice in a four or five-foot shot of him trying to land the fish every 75 or 100 feet through the story. End the picture with the last scene of him finally landing the trout.

If you have a friend or relative in a training camp and you are making a film of marching and general camp activities, here's a chance to use the "potato peeler" gag. Shoot about six scenes from different angles, of one of the boys peeling potatoes outside of the camp kitchen. This is wonderful when cut-in throughout the finished picture.

Or perhaps you are making a picture on college sports. Early in the film show a scene of two wrestlers. Arrange to have one of them get a leg scissors on the other wrestler's head and keep it on while you make five or six shots from different angles of the wrestler trying to break the hold. Then go on with all the other sports, and in editing put a wrestling shot in at suitable intervals.

In making a film on the activities at a businessmen's club, make a shot of two chess players, one of them trying to make up his mind which chess piece to move. Have him hesitate in his play, then put the piece back

where it was. Repeat this shot six or eight times and when it's cut-in to your finished film it will provoke a lot of laughs.

Then there's the gag where a friend stops at a bar for a drink and each time you flash in your film the friend is having another drink and getting tighter and tighter until the last scene shows him out cold.

The running gag can involve the use of animals and pets. Fido chasing a cat—or a pig eating at a trough—a dog digging a hole in the ground, etc.

The same type of treatment can be given to any situation wherein the action taking place should normally complete an operation in a short period of time. By use of the running gag, the action is extended and appears to never end.

In the old slapstick type of comedy, a type of running gag was often used as a series of flashbacks.

The villain has tied the heroine to a log in the sawmill and starts the log moving toward the saw. We then flash back to the hero racing to her rescue—then, back to the girl on the log moving steadily toward the saw—then, back to the hero stopped by a flat tire—then, back to the heroine on the log—then, back to the hero—and so on, until he finally draws his gun and with a single shot severs a high tension cable and cuts off the power—stops the saw—and saves the girl. This type of cutting is really a flashback and is not truly the "running gag" treatment.

In some cases the running gag can be elevated in importance to carry a part of the picture interest. This becomes a dual plot type of story and is best illustrated by the story of the widower and his son who are both wolves with the ladies.

The widower meets and falls in love with a widow and his son meets and falls in love with her daughter.

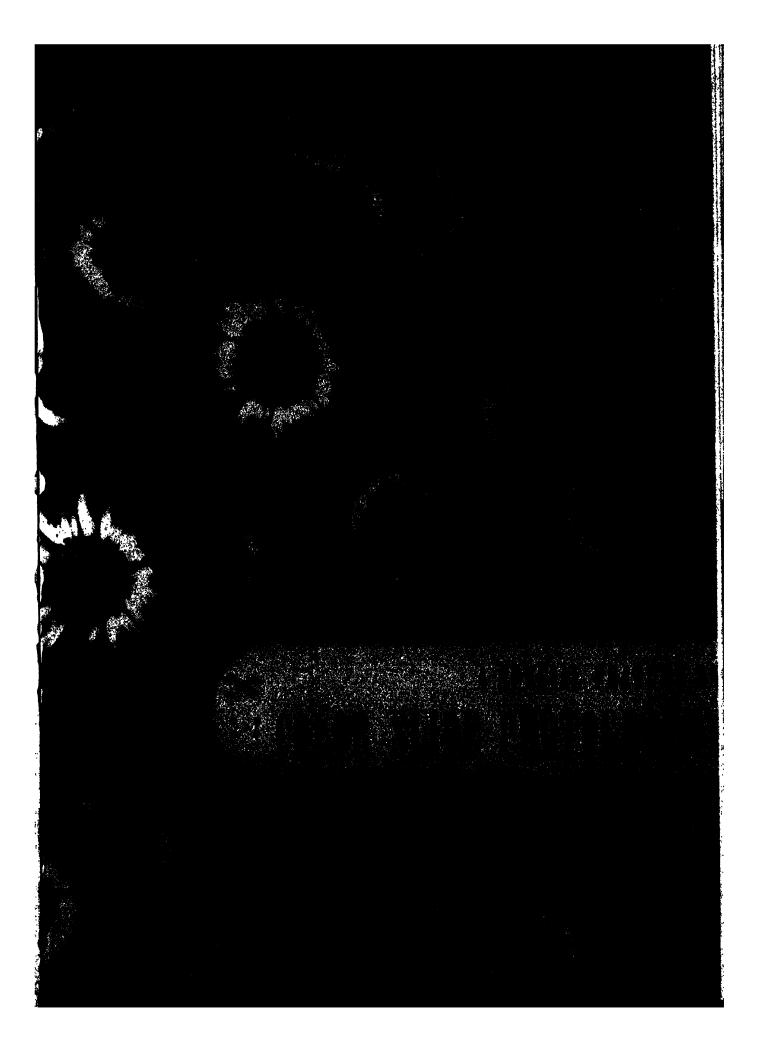

The father and mother each claim that they have no children and as a result, a plot of intrigue and deception develops.

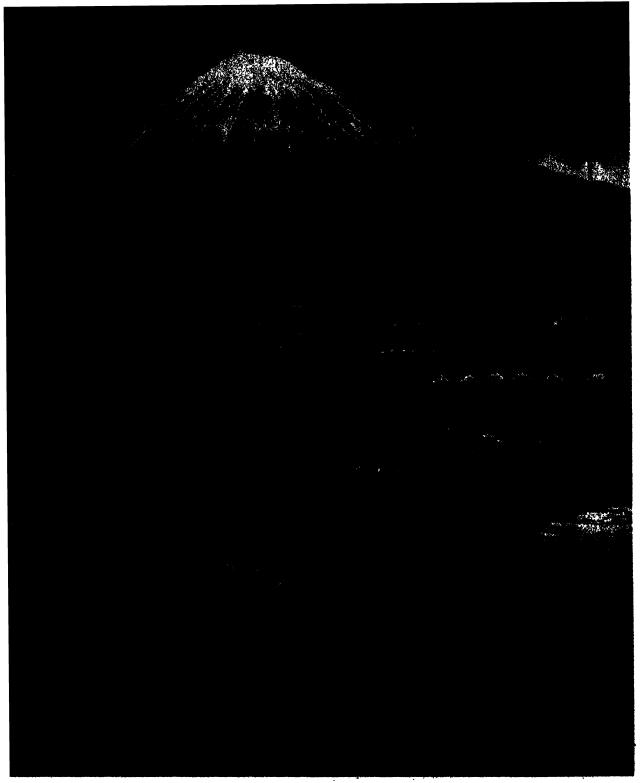

The trials and tribulations of the young couple carry the major story interest but the parallel complications of the father and mother as a "running gag" enhances the plot and picture interest.

Of course, it is not always possible to have the desired incidents happen when you want them to. However, this is no problem, because in a majority of cases you will have to stage your gag, and this can be done before, during, or after your film is completed.

It's quite possible that you already have several vacation or other types of films that lack a punch. Project your films again and see if you can't develop an idea into a running gag. It's not too late to make gag shots to insert into films regardless of how long ago they were made.

While the professional movie maker has many manufactured opportunities such as these to use the "running gag," the amateur can develop new and novel situations which will serve his purpose. As stated earlier, the travel type of picture offers the amateur the widest range of possibilities but the "running gag" can be used effectively in any type of film subject. One's imagination is the only limiting factor.

MT. FUJI AND RICE PADDIES

W. A. Price

This 32-page special color feature of the PSA JOURNAL was assembled under the supervision of Paul J. Wolf, APSA, Secretary of the Color Division and Eastern representative of the Color Division Editorial Committee. Other members of this Committee assisting Mr. Wolf were: Harry G. Mitchell, of Chicago, Merle S. Ewell, APSA, of Los Angeles, and Karl A. Baumgaertel, APSA, of San Francisco.

GEORGE F. JOHNSON, APSA, Chairman, Color Division

Photogenic Japan

W. A. PRICE

It was down and our ship was anchored in a sea of mist. Slowly objects began to take form as the rising sun gradually forced the curtain of fog downward into the earth. Ghosts that became other ships appeared on either side of us and two small lighthouses appeared on the end of a breakwater. Quite suddenly a light colored form began to take shape above the mist far away, becoming brighter and brighter until in sudden transformation the beautiful snow-capped cone of Mt. Fuji stabbed its way upward into brilliant sunshine far above the surrounding clouds.

Such was my introduction to Japan on a fall morning in 1948. I had arrived in Tokyo Bay just outside of the Yokohama breakwater during the night and it would be almost three years and many rolls of Kodachrome later before I would again leave this part of the world, photogenic Japan.

My purpose in being in Japan was not photographic, but fortunately my work as a civilian communications engineer for the Department of Army required that I travel extensively throughout the country, and my cameras were always with me. My favorite pasttime and luxury was photography in color and most of my spare time was taken up in exposing film wherever I happened to be, weather permitting, and sometimes when it did not.

My favorite cameras were the Leica and Rolleislex and, of course, I used my pet light meter consistently. However, I want to point out that because of the high humidity and variable weather conditions in Japan, my eyes did not always agree with the meter readings. I had learned long before to believe what the meter says, and if I ever went

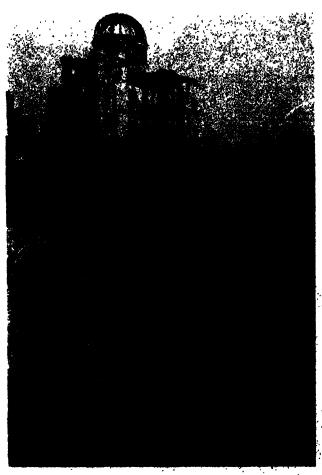

wrong it was not the fault of the light meter.

I used Ektachrome and Ansco Color in the Rolleiflex when I could get it because good monochrome prints can be made from transparencies of this size and the advantages of color transparencies are retained. However, most of the time I was able only to obtain black and white films, sometimes American, other times Belgian, German, or Japanese. Incidentally, the Japanese film produced quite good results although it is made only in a slow emulsion comparing to ASA24 or thereabouts.

In the Leica I used Type A Kodachrome almost exclusively except for the few times that I could not purchase it and borrowed daylight type from friends. With Type A and conversion filter for daylight, I felt I was getting a little bit better results in cutting through the ever-present haze that exists in Japan. Also, with this film always in the camera I was able to obtain, in addition to daylight pictures, night street scenes and indoor theater shots on the same roll of film without any bother. Further, I think that daylight Kodachrome, even with the skylight filter, produced for me a slightly colder trans-

parency than I obtained with Type A film and my personal preference is toward a warmer tone.

After getting my feet on the ground in Yokohama this fall morning in 1948, I looked about me to obtain intentionally a number of first impressions as these are the ones that are never forgotton. I could see pictures, pictures, pictures! The hustle and bustle of an almost westernized oriental city was exciting, romantic and exotic. Street traffic kept to the left, and intermingled with modern automobiles were ox-drawn carts obeying modern traffic lights. Bicycles were everywhere and each carried a load behind the rider, fish, flowers, household goods, sometimes boxes stacked as much as ten feet in the air, all of which were being delivered to some place or other in the regular course of business. Women with children tied to their backs, wearing kimonos and the wooden foot clogs called geta,

HIROSHIMA

W. A. Price

SPEARING FISH IN SEA

W. A. Price

were intermingled with oriental and caucasian people wearing western style clothes. Little shops and stalls along the street where souvenirs, fish, household goods, and most everything else were sold were scattered among western type brick and concrete office buildings.

Japanese men on the street all carried briefcases, the contents of which ranged from lunch to shoes, papers to money, and what not. Japanese women carried a furosheki which is a large square of colored cloth in which are tied their packages and possessions which American women would carry in a pocketbook. Many men also carried a furosheki and it is a very practical idea.

I was driven that morning to Tokyo by car and on that 20 mile trip I could see concrete factory chimneys standing out against the sky for miles and miles in no regular pattern as if someone had set up thousands of ten pins at random all over the landscape. These chimneys rose from the bare ground among vegetable gardens, barley fields and concrete foundations and they silently and pictorially told the story of what war can do to an industrialized area.

Although the urban centers in Japan are very interesting with their conglomerate of East and West, the real and old Japan which interested me more was the rural areas where western influence has not penetrated too firmly. Here are found age old farming methods, modes of dress, religious festivals, architecture, etc., and it was in these area where I most enjoyed taking my color slides.

My family arrived shortly in Japan, my wife Ruth, 13 year old daughter Billie, and one year old son Tony, bringing our car with them. Our first drive out of Tokyo on a week end was over 80 miles of rough dirt road to the town of Yoshida at the foot of the north slope of Mt. Fujiyama, or Fuji-san as it is respectfully called in Japan. Mountains are no novelty to us Coloradoans but Fuji immediately captured us, heart, body and soul. We found later through much experience with the climate that our first trip up to Fuji was one of our best for visibility and weather. The perfectly symmetrical cone stood out that day as if to welcome us. It wore its winter snow cap all glistening and pure white, the sky beyond was flecked with small fleecy clouds, and the curves of its sides seemed to flow downward and outward in a perfect harmony of music.

We stood at the foot of the mountain and gazed in fascination up its slopes to the summit 12,388 feet above the sea, and we understood why the Japanese hold Fuji-san in such high reverence. The mountain seemed to live and move and change continually although it has not erupted for about 240 years. As we watched, the mountain changed

color at the base from deep purple to powder blue to black-green and back again as wind currents alternately condensed and evaporated the humidity in the air. Small clouds would form near the snow line and in a moment be gone. In one instant the entire mountain would be crystal clear and sharp and a moment later it would be a dark blue-gray silhouette against a lighter blue-gray sky. Fuji-san gave us a royal welcome that day, and since then we have held Fuji-san in esteem as one would a living personality. We, except for Tony, have climbed it; my wife once, Billie three times, and I four times. We have visited it on every side dozens of times and have taken a few hundred pictures of it. We have been caught in a violent snow storm on it, have been almost blown off the top in a 100 mile per hour gale, have almost been roasted on its south side in midsummer heat and many times have driven to it only to find it completely hidden in clouds or storms. The moods of Fuji-san are its fascination, and the capture of these moods in photography is no small challenge. Fuji-san is the most unsuccessfully photographed object in Japan.

Japan probably owes much of its photogenic character to its rugged terrain as only about 17 per cent of its area is suited to agriculture. Consequently, there are exotic pictures to be taken most everywhere. There are rice paddies winding in serpentine fashion down narrow valleys, rugged sea coasts where spray dashes high in the air while men, women and children gather moss and seawced from the rocks for food, fishing boats winding among small rugged islands with their nets, hundreds upon hundreds of hot springs flowing out of the rock in steep canyons and on steep hillsides, and countless other subjects. Every area in Japan, from Hokkaido in the far north to Kyushu in the far southwest, has its own natural beauty.

Every area and every town has its Shinto shrines and Buddhist temples, but the city of Kyoto, which was not damaged by war, contains the largest and most famous group of any area in Japan. The Nara area which is near Kyoto and which is probably the birthplace of Japanese culture and art also contains many famous shrines and temples. The shrines at Nikko, about 90 miles north of Tokyo, are very famous and are probably the most ornate. The beautiful carvings and gilt work, the unspoiled oriental flavor of the architecture, the solemn gates or torii which stand majestically alone, the enormous cryptomeria trees, all of these subjects await the photographer in nearly every part of Japan.

Plum blossoms in early March and cherry blossoms in early April blanket the countryside in solid masses of pink and white. They frame old feudal castles and try to conceal age old masonry walls, adding a further oriental touch to colorful kimonos as Japanese girls stroll among the trees during the usual festivals at plum and cherry blossom time.

In late October the entire countryside again explodes into color as the maples turn to crimson. They are found everywhere and under the same conditions as are the cherry and plum trees. The most famous area in Japan for fall coloring of maples is at Lake Towada in the northern part of the main island of Honshu. Here is located an enormous crater lake of the deepest blue entirely surrounded by heavily wooded mountains. During the red maple season, the brilliant reds and greens of the trees and grasses combined with the blues of the lake and sky and shout to the photographer for attention.

Add to all of these landscape and pictorial scenes, the soft haze in the valleys in the mornings and evenings, the red sunsets, the frondlike susuki grass, the wild palms, the everchanging clouds, and it becomes evident that in Japan there is a picture at every turn.

There is also just as much to be photographed from the human interest viewpoint in Japan. As mentioned before, the cities for the most part are combined Eastern and Western and the resulting contrasts in customs and activities are good photographic material. In the rural areas, however, may be found a good cross section of the old Japan where rice paddies are plowed with oxen and wooden plows, where young children play unmindful of a baby brother or sister strapped to their backs, where almost naked fishermen and women pull in the fishnets from shore, and hundreds of other subjects.

It is only upon occasion that a Japanese objects to being photographed, differing in this respect from the people of many other areas throughout the world. However, it does require a lot of patience and usually a little honest trickery to obtain the natural and unstilted picture that is desired. It seems to be almost a rule that any Japanese who sees that he will be included in a picture immediately strikes a pose for the benefit of the picture. He or she will face square on to the camera in a stiff attitude and with a forced smile or feign an imitation nonchalant drape around a tree or object or something of that nature. The language barrier makes it difficult to get the idea over that posing is definitely not desired.

The tricks that I have resorted to are usually devised on the spot. One of them was to use a telephoto lens. There are times, however, when it is not possible to retreat far enough from the subject to do this or if the subject is aware that a picture is to be taken, the changing of a lens will not help.

A simple little trick that I have used was to face at right angles to my prospective subject and focus on a spot approximately the same distance away. If and when the subject finally relaxed and decided that they are not involved, and sometimes that never happens, I would swing around and get the shot before the subject realized it. I have also focused for a shot while the subject was posing and then pretended that I had suddenly seen something else more interesting. By staring in a different direction for a moment, the subject invariably would relax enough to also turn to look at the object of my curiosity and then I would turn for a quick shot. There are many such tricks that a person can devise when the accasion demands, and in Japan it is usually necessary.

With modern miniature cameras and high speed lenses, there is little reason not to use fast shutter speeds and hand held shots and still retain sharpness and reasonable depth of focus. My basic exposure with Kodachrome in good light was 1/200 second at f/4, and it was not often that it was necessary to stop down to slower shutter speeds for sufficient depth of focus with a 35mm camera, particularly for the kind of human interest pictures usually desired. I have taken prize winning landscapes at 1/500 second at f/2.5 from open train windows with plenty of tolerance for depth of focus. Of course, I have my pet tripod and I have had to shoot some pictures at ½ second at f/36 on a bright day with a telephoto lens in order to get the picture I wanted, so I do not mean to infer that slow shutter speeds are never necessary.

Because of the great variety of photographic subjects

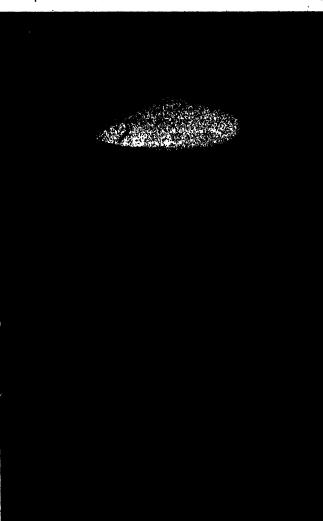

in Japan, a person finds himself passing by good pictures because he sees too many things at once. Some day when it is too late he will discover that many subjects are short in his slide file, while there may be an excessive number of slides on other subjects. Assuming that a person will be in Japan for a reasonable length of time, it would be well to make up a slide index by subject matter first and then review this file periodically to determine what is missing. Then special effort can be directed toward getting just those certain pictures before it is too late and he finds himself back in the States.

My own slide file is broken down into about 35 subjects, and I find that after all of my time in Japan I still wish that I had covered some subjects more thoroughly. Take "Transportation" for instance. There are ox carts, bicycles, 3-wheeled taxicabs, pedicabs, rickshaws, wood-burning trucks, busses and cars, street cars, streamlined trains, boats and ships, etc., and all of these can be photographed in a way that will indicate the old Japan or a contrast of old and new. The same can be said of other subjects such as street scenes, farming, fishing, landscapes, seascapes, people at work, festivals, shrines and temples, mountains, harvest and crops; the list can go on and on. The important point is that one should go after certain types of pictures at times because many subjects must be sought after, and others become so commonplace that photographing them slips one's mind.

I may have given the impression that photography may be done practically every day in Japan under ideal conditions. Actually, it is the reverse of this. The ideal

PREPARING RICE PADDY

W. A. Pric

EATING RICE W. A. Price

day is a rarity indeed, and it seems to all photographers that the poorest weather always occurs on week ends. There is usually extreme humidity in most of Japan with its haze and clouds. There is much rain and occasionally a typhoon in summer. There are times when there is no direct sunshine for weeks, so it is all the more important to capitalize on the good weather by getting the kind of pictures needed to fill out the file. When good weather is at hand it may last a day or as long as a couple of weeks but one should never pass up a good opportunity to take pictures.

Springtime is the most colorful period of the year in Japan and the brilliant flowers are gorgeous. Camellia and plum begin to bloom in February, followed by cherry, peach, wisteria, and azalea. In addition there are hundreds of other varieties in certain localities but in nearly all cases the season is short for any individual type. It is necessary to take pictures of most varieties of flowers within a span of a few days while they are at their peak. This means advance planning and scheduling and then,

in addition, being lucky with the weather. I tried for three years to get some wisteria pictures on the outskirts of Tokyo because of bad weather during the short blossoming period. I also tried for three years to get a picture of Fujisan framed in cherry blossoms and was weathered out every time. The cherry blossoms last less than a week.

On the other hand, I once drove for three and a half hours in the evening to the foot of Fuji-san for a sunset picture when the mountain was not even visible when I left Tokyo. I arrived within five minutes drive from my chosen vantage point when the sky suddenly broke open and the mountain became visible just as the sun began to set. I had to drive about two miles further, set up the camera on the tripod and shoot my picture, all within ten minutes, but I made it. That picture was later voted the best picture of the year at our Circle of Confusion Camera Club in Tokyo. A person can be lucky once in a while.

I hope that you too are lucky and have an opportunity some day to relive some of my pleasant experiences in addition to many others of your own in photogenic Japan.

Still Life In Color Slides

ART F. SHEA

COSH," you say, "I need some new slides, something different." Then, why not try still life?

Making still life pictures on color slides of many of the things we all have around the house can be fascinating

and a challenge to our photographic ability.

You have undoubtedly read articles, now and then, on still life work, and passed them up, thinking you would try it some time in the future, but never getting around to it. Some will say that they have little training for such things, they don't know how to arrange objects, or what to put into the picture. It takes so much time, they argue. But a little time spent at this is good photographic training, and really, it won't hurt a bit.

The dictionary tells us: "Still life—a picture of inanimate objects, such as fruits, flowers, etc." We might add vases, bowls, jugs, clocks, plates, and a lot of other things around the house, or the workshop, or even from the kitchen.

Take a look around, and you will find objects in every-day use that can be made into a picture. How about trying balls of colored twine, spools of thread, ornamental plates and bowls, bottles, clocks, and so on and on. All that's needed is a good idea for a composition, and an arrangement that is artistic, or has a good pattern. If it tells a story, and has a good color scheme, well, that's it.

You can make a good start by placing your subjects on a table or a board that is nice and smooth. If it is painted the right color you won't need to use any cloth or drape. If not, use a ground cloth that is in color harmony with the subject. For a background, use a 16 x 20 mounting board. A plain background is best in most cases. Then make the setup according to your idea. Check it, trying several different arrangements if necessary, and you will be off to a good start. Of course, at times you will find that it isn't quite so easy. Sometimes an hour or more will be spent, and still you won't quite like the setup. But even so, you will learn from your errors. Keep at it, make changes, you may notice something placed in a wrong position, and in the end you will come up with a picture.

Remember that you have complete control of your models, they do not get tired, or want to go home early, or look down when you want them too look up. You cannot complain on that score, for the controls are entirely in your hands, and there is no pressure from the models. You can make all the changes you wish, until the picture is as you want it.

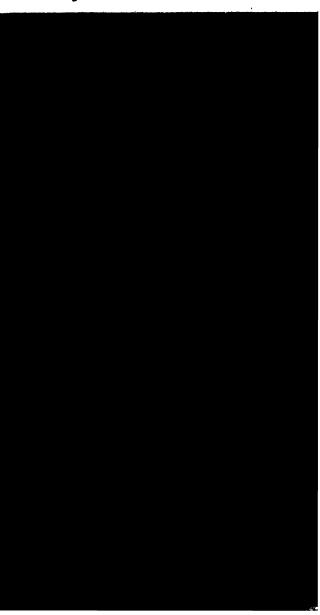

Textures are of great value in adding interest when you are working on a setup. Texture and pattern are im-

PSA JOURNAL, Vol. 18, Mar. 1952

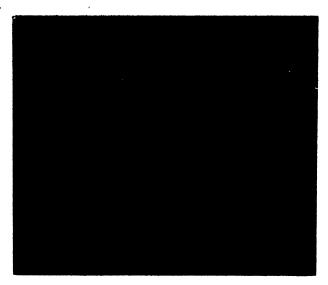

portant, they lend themselves to effects with light and shade, and they can be made very attractive. Texture tells a story, also. Silk is smooth, elegant. Cord or twine is rough, hairy. Glass is clean, shiny, clear, tinted. Needles are bright, pointed, metallic, etc.

Next comes lighting. You can light any object a great many ways. Remember that a famous photographer took

Making the set up on table in ballway in daylight. Note shedows cast by folders on left. Paper was placed on banister to cast shedow on background.

over a thousand pictures of a cup and saucer to learn lighting. As long as you obtain the effect you set out to achieve, the lighting is right. Remember, too, that your picture will have to please the judges, or perhaps art critics, and the more care and skill and thought you use, the better your result will be.

Camera used, 51/2 in. lens, 35mm roll film back

Try the light off to the right, or to the left, and see what it does for the picture. Try front lighting, backlighting. Try the lights low, then high. Watch the different effects, and select the best. At the start, a single #2 Photoflood in a reflector, on a stand, is all that is needed. If

you have a spot, it can be used with good effect. If you use two lamps, be careful of crossed shadows. Most pictures should have a single main light source, and the second or additional lamps used for fill-in only.

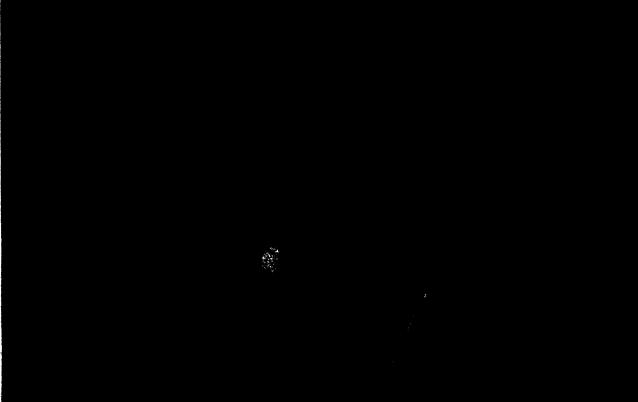

In my own work, I like to use a single #2 Photoflood with a reflector on a stand. I can move it anywhere I want, raise it up, or lower it, back it up, move it forward. I like side lighting best since it shows up textures and makes shadows part of the picture. It also gives more depth to the picture, a third-dimensional effect that is pleasing. If the side-lighting leaves the shadow side too dark, use a fill-in light near the camera to illuminate the darker side, or reflect light into the shadows with a white mounting board. Remember to keep your fill-in light weaker than your main source, so as not to spoil the effect of the main light.

Put shadows into the picture by any method you can devise, for they add a lot to the effect and impact. I use paper advertising folders, or folded cardboards, and stand them at the right place to intercept the light. I have various sizes, and heights, and use them as necessary. Those from four to seven or eight inches high are very useful. Taller cardboards can be used for control of the light on the background, or if your reflector has "barndoors" they'll come in handy.

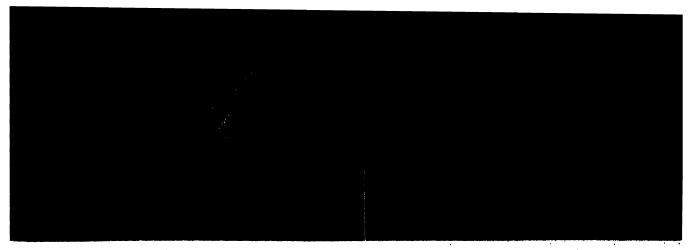

Watch the light on the background carefully, and be sure that it doesn't compete with the main subject, by being too bright. That, of course, is something you'll have to decide for yourself, for sometimes a bright background is best. If the background is colored, be sure that it is in harmony with the subject. In general, the base of the picture should be a bit darker than the background.

Of great value in the making of color slides is the study of color harmony. Most of us have some color appreciation. It may be untrained, but we all know what we like.

Picture enlarged from bowl and flowers; slide was made at this time also

Thread and Twine

Needle and Thread

A color wheel is a very useful thing to own, and studying it will improve your color sense. You can get color wheels and guides at art stores, and most books on painting and sketching have chapters on color. Nature is one of our best guides for color schemes: flowers, plants and land-scapes are good examples.

As for equipment, while any camera can be used, for practical purposes the 828 and 35mm sizes are most satisfactory, and if your camera has a groundglass for focusing it will make your work much easier. The reflex types are good, too, but perhaps the most satisfactory of all are the larger size cameras with 828 or 35mm adapter backs. Longer focal-length lenses are helpful in this sort of work. Supplementary lenses may be used on cameras that don't have double-extension bellows. Instructions come with the supplementary lenses, and usually the salesmen at the camera stores are glad to answer your questions, if they can. If your camera has a removable lens, the Speed-O-Copy or Focaslide attachments can be used. If not, you can try

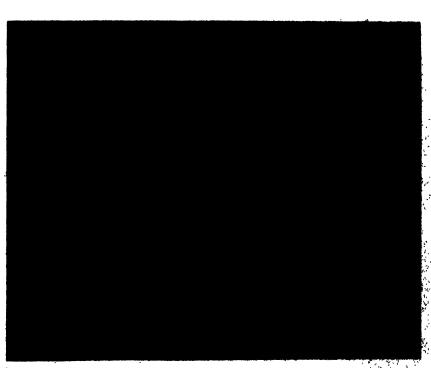

a focal frame finder, such as is described in Eastman Kodak's booklet on "Portra Lenses."

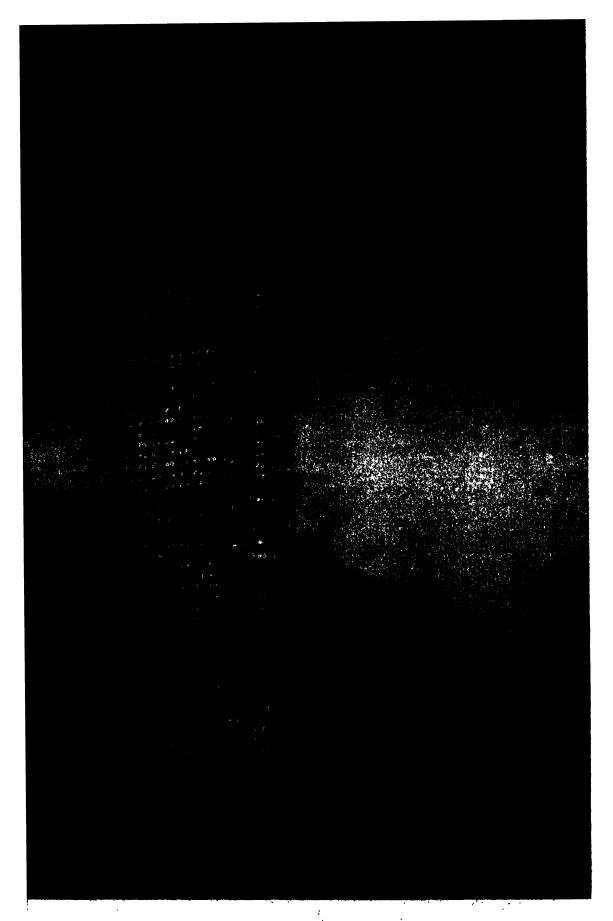

Remember to use Type A Kodachrome with Photofloods. If you are using tungsten-type Ansco Color, you'll need a UV 15 filter with the Photofloods, or else use 3200 Kelvin lamps. Daylight film is not advised, as the color balance is off for artificial light, and the conversion filters make long exposures necessary. Even with a stout tripod, which I have assumed you will use, it is best to keep your exposures as short as possible; since you will need all the depth of field possible, very small stops are a must. A light meter is also an essential, but use it with care, for it is your only guide to exposure. It is difficult to guess exposures for still lifes, so be sure your meter is in good shape, and then, after you know how to use it, trust it. A good meter won't let you down.

And so, let's get going, and try some still life in color slides. You will find this pastime both interesting and instructive.

Sewing Basket

These three slides were made on Kodachrome Type A film, on a 9 x 12cm German camera, with a 135 roll film back. The camera has a 5½ inch Schneider lens. Exposure 3 sec. at f/18, and sometimes f/20.

NIGHT SHOTS IN COLOR

PAUL J. WOLF, APSA

A MONG the most spectacular subjects within reach of the photographer who lives in or near a big city are night shots in color. They are not hard to do, and the results when properly done, are often breathtaking in the extreme.

All that's needed in the way of equipment, in addition to your camera which, of course, has a lens shade and cable release for you will be working with long exposures, is a stout tripod and plenty of patience. A light meter is a great help sometimes, but it is possible to do good work without one. And sometimes, too, there simply isn't enough light to register, so good judgment and experi-

ence can well substitute for a meter at night.

There are several distinct types of night shots, each calling for different techniques. First, let us consider dusk shots. These can really call forth the "oohs and aahs" from your audiences. For the most spectacular effect, you want the silhouette of the tall office buildings, ablaze with lights, against a sky still bright with the after-glow. That means you are limited to the months of November, December and January for best results, since you need the day dark enough for office lights to be on, but the sky must not be so dark that the outline of the buildings is lost against it. To make it easier, select the spot from which the shot is to be made in advance. Plan to get there and set up your camera on its tripod, if possible facing west to the setting sun, about 4:45 P.M. By that hour, the sun will be gone, and on a clear night the sky will be luminous and alive with the after-glow. You can expect very dramatic effects.

After setting up, calculate your exposure by metering on the sky, if you have a meter, and give a generous exposure. If you underexpose, you will lose the outlines of the buildings against the sky, and the office lights will seem to hang in space, which is not the best effect for this kind of picture. On the other hand, if you overexpose, all that will happen is that the sky area will be lighter and brighter which enhances the drama. If you do not have a meter with you, try an exposure of one second at f/4.5 to start with, then try two seconds and four seconds with the same opening. Probably all your shots will be interesting, and you will get usable results on a clear night at any of these exposures, the only difference being in the color and brightness of the sky.

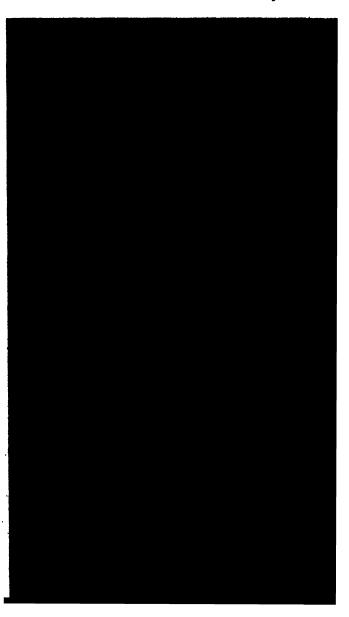

These shots are best made just before 5 P.M., for it will amaze you to see what a difference 15 minutes will make. By a quarter after five, many of the offices will have closed for the night, and turning out of lights will black out large areas of the buildings. Try to get your shots just be-

fore 5 P.M. when all the office lights will be on, and don't hesitate to work for dramatic effects.

In making night shots, my preference is for Type A or tungsten-type film, but if your camera is loaded with daylight film, don't let it stop you, for it is still possible to get interesting and worthwhile results. Of course, the color balance will be off on the reddish side with daylight film, but sometimes the effect is even more striking that way. Since these are "effect" shots, rather than straight

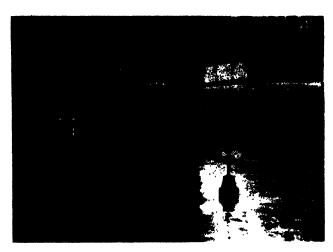

NIGHT AND POWER

Paul J. Wolf

records, it is best not to use a filter at all, but to take advantage of the full speed of the film.

The second type of night shot is not just a dusk shot, but is really done at night. The streets at night, especially in the business or amusement areas of your city, present many fine opportunities for worthwhile pictures. Your best bet is to try a rainy night, or as an alternative, just after the streets have been flushed down, and are still wet. You need the reflections and "kick" of light from the wet pavements to liven up and add interest to what otherwise would be a dead black, lifeless area. Compose this kind of picture with care—that's good advice anytime—and be sure to make full use of the reflections.

RAINY NIGHT-TIMES SQUARE

Paul J. Wolf

If you are so fortunate as to be taking your pictures in the Times Square section in New York, or the Loop in Chicago, or in any of the other similar well-lighted areas in the larger cities, you can be pretty sure of acceptable results with an exposure of about one second at f/4. It is better to try to keep your exposure on the short side in this type of shot, as far as you can, for with lengthy exposures, you are apt to get streaks of lights from the head and tail lights of passing cars. These can be avoided by waiting until traffic stops, or by watching for a lull in traffic for your exposure, but it is sometimes difficult to find a lull in the busier areas. And then it is no fun to stand around in the rain trying to get a shot. It isn't too good for equipment, either. Perhaps the better way is to take your shots both with and, if you can, without the light streaks from head and tail lights, and then decide which you prefer. Sometimes, the streaks add to a picture. In that connection, here's an ancient dodge for getting around such light streaks. In the old days, when the derby hat was popular, when you saw a lighted vehicle approaching, you merely held the derby over your lens. Made a swell lens cap, too. You might see how a modern snapbrim will work out.

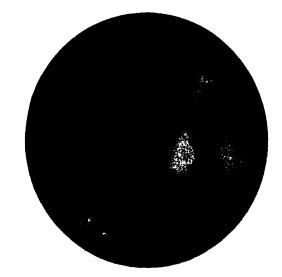

The third type of night shot in color is the recording of electric signs. Since these are in themselves light sources, they usually make interesting pictures, and well repay the effort of getting out to take them. With these shots, wait until it is really nighttime. That will eliminate unwanted detail, such as the girders usually supporting an electric sign. That's detail you can surely do without! Again, one second at f/3.5 has worked out well for me, but to be sure, try one with two seconds and four seconds as well.

If you need added depth of field to handle a foreground object, then stop down, but don't forget to increase your exposure time to compensate for the smaller stop.

A very interesting variation may be tried if your can gain access to one of the upper floors of a skyscraper. "Downshots" are fun to make, and always command attention. You will find that exposures as long as 20 seconds at f/4.5 are sometimes needed, even in the better-lighted areas, to secure satisfactory detail, but it is hard to really overexpose this sort of shot, so be generous with your exposure. It is usually a good idea to start at about 10 seconds at f/4.5, then take 20 and 30 seconds as well, on a clear night, and if the weather is not clear, your time might go up to a minute or more. That's something only experience can tell you.

If you have a really rock-steady tripod, and can set up your camera in a place where it won't be disturbed by people, or by the wind, and there are no vibrations to bother you at the wrong time, here's a very productive procedure: take your first exposure late in the afternoon, and then wait until night, and take a second exposure on the same film. The first exposure will give you the buildings and landscape, and the second exposure at night will light up the windows, and street lights, and in general help make what sometimes is an ordinary sort of picture into a winner. The technique here calls for taking your first exposure rather late in the day. Take a meter reading and expose by it. If you don't have a meter try ½ second at f/5.6. Then, after dark, shoot at 20 seconds at f/4.5 for your second exposure, which will record the lights. Be sure your camera is out of the wind, and be doubly sure that no one, including you, knocks the tripod. You must take the second exposure in good register with the first, and that means no movement between shots, if you are to obtain good results.

One more thing: you might as well be prepared for lots of comments and wisecracks from bystanders, for the general public still thinks pictures are only possible in broad daylight. I've never been out at night with my camera without arousing much interest and ill-informed comment. But don't let it get you down. By and large, this business of night shots in color is well worth the effort and trouble, and when you've seen your results, I think you'll agree. Good shooting!

TOP O' THE TOWN

Paul J. Wolf

Kelvin Temperatures and Color Films

THE photographic literature relating to the use of artificial light sources with color films usually specifies these sources in quite definite terms, such as 3200 K. This is especially true of the tungsten sources since these enjoy the widest application.

We have little difficulty in evaluating the numerical designation of these terms, but may be confused by exactly what they represent, as well as by the letter "K" which follows them. Perhaps we are told that "K" is an abbreviation for the word Kelvin, and that this is a temperature scale; but since we are unfamiliar with these things we cannot evaluate them in terms of the centigrade or more commonly, the Fahrenheit scales.

It should be of somewhat more than passing interest, therefore, to consider briefly the various temperature scales, and the differences which exist between them so that the photographer can at least be on speaking terms with them, or be able to convert each into the other by mathematical means.

Before considering these temperature relationships in greater detail, it may be of interest to consider briefly, the method employed for temperature measurement prior to the introduction of the mercury thermometer.

The construction of the first thermometer is attributed to the great Italian physicist, Galileo, in 1592, at the University of Padua in Italy. He was familiar with the principles of expanding gases, liquids, and solids; and since gases expand more than liquids or solids, he chose a gas as his expanding medium, and constructed an instrument accordingly. It was a crude affair consisting of a slender glass stem open at one end. The opposite end was fashioned into a glass bulb. The stem was partly filled with liquid and the open end inserted in a container of similar liquid. The relative temperature of two substances was determined by observing which of them, when placed in contact with the gas-filled bulb, caused the liquid to descend fartherest into the stem. Unfortunately, barometric as well as temperature changes caused changes in the height of the liquid, but Galileo apparently was not aware of this.

It was not until about 1700 that mercury thermometers were invented, and because of their extreme convenience they have replaced all others for practical purposes.

A temperature measuring instrument containing mercury was devised by G. D. Fahrenheit, of Danzig, Germany, in 1714. It consisted of a thick-walled piece of glass tubing of very small internal bore, at one end of which a bulb was blown. Bulb and stem were filled with mercury at a temperature slightly above the highest point for which the thermometer was to be used. The open end of the tube was sealed off, and as the mercury cooled, it contracted, falling away from the top, leaving a vacuum above it

Boung Point of 113 and 115

Pure Woter of 12 disposition of 12 and 12 an

W. K. RAXWORTHY*

To calibrate the instrument, the point at which the mercury stood when the bulb was immersed in melting ice was marked 32, and that reached when the bulb was placed in boiling water was marked 212. The space between these two marks was then divided into 180 equal parts. The zero point was determined by placing the bulb in a mixture of equal parts by weight of ammonium chloride (sal ammoniac) and snow, and it is interesting to note in this connection that Fahrenheit thought that the point so reached represented the lowest possible temperature, signifying, as he supposed, the entire absence of heat.

The Fahrenheit thermometer is of little, if any, scientific value now-a-days, but it is the instrument commonly employed for household purposes in this country and in England

The centigrade thermometer was devised in 1742 by the Swedish astronomer, Anders Celcius. For this reason it is frequently referred to as the Celcius scale. It is substantially similar to that of Fahrenheit except in the manner of its calibration. To calibrate his instrument, Celcius placed it in melting ice and marked the point at which the mercury stood, 0. Then it was placed in the steam arising from boiling water and the new position of the mercury was marked 100. The space between these two points was divided into 100 equal parts and these divisions were extended above the 100 mark and below the 0 mark, to complete the designed range. Thus the difference which exists between the Fahrenheit and centigrade instruments is not one of design, but in the method used to calibrate them.

Centigrade thermometers find greatest application in the laboratory, where they are employed for most ordinary scientific purposes involving temperature ranges of from approximately 39 degrees below zero to about 350 degrees above zero

From a consideration of the methods used in calibrating the respective instruments, we find that 180 on the Fahrenheit scale denotes the same temperature difference as 100 on the centigrade scale. Therefore, 1 Fahrenheit degree is equal to 9/5 of a centigrade degree, and 1 centigrade degree is equal to 5/9 of a Fahrenheit degree. These relationships can be used to convert the temperature of one scale to that of the other, and the two formulas used to accomplish this are stated mathematically as follows:

$$C. = (F. - 32) 5/9$$

 $F. = (9/5 C.) + 32$

As an example of the application of these formulas, we

^{*} Technical Adviser, Color Division, PSA.

wish to determine the centigrade value of 212 F. By substitution in the appropriate formula we obtain

and conversely, we can convert the centigrade value thus obtained back to its former value by applying the second formula as follows:

Thus we can convert any temperature on either scale to the corresponding value on the other.

As the general knowledge of the behavior of gases increased, it was found that for each change of 1 degree centigrade, hydrogen gas would contact approximately 1/273 of its volume at 0. It is reasonable to suppose, therefore, that continued cooling of the gas to a point 273 degrees below 0 C. will reduce the volume to nothing. If we neglect the strictly thermodynamic considerations, this is indeed the case, and accordingly a new zero point was necessary to record the extremely low temperatures suggested by this additional knowledge. The establishment of such a point is credited to Lord Kelvin (Sir William Thompson), a Scottish scientist, and this point is called absolute zero or 0 Kelvin. Temperature measured from this zero is called absolute or Kelvin temperature. It has never been reached in practice, but has been approached to within a very small margin.

Thus, Kelvin temperatures are expressed in terms of degrees centigrade, and to convert them to the corresponding centigrade values we need only to subtract 273 degrees from the Kelvin reading as indicated by the following formula:

Centigrade temperature (C.) = Absolute temperature (K.) -273 and conversely,

Absolute temperature (K.) = Centigrade temperature (C.) + 273 To illustrate the application of this formula, it is desired to convert 3200 K. to the corresponding centigrade value.

To complete the conversion cycle, we can now transform this value into the corresponding Fahrenheit temperature by applying the appropriate formula as indicated.

From the foregoing considerations, we can see that the zero point on the Kelvin scale was determined from thermodynamic considerations involving the relationship between a volume of gas at 0 C. and the centigrade temperature at which this volume would, upon sufficient cooling, be reduced to nothing. This is by way of comparison with the somewhat arbitrary methods used to determine the zero points on the Fahrenheit and centigrade scales. It is interesting to note therefore, that Kelvin temperatures are always expressed as positive or "above zero" values, since temperatures lower than absolute zero cannot exist. On the Fahrenheit or common household thermometer, this point would be indicated as 459.4 degrees below zero. Because mercury solidifies at approximately 39 degrees below 0 on this scale, such thermometers cannot be used to indicate temperatures below this point, and other methods must be employed.

Color Temperature

Light sources for color photography are designated in terms of color temperature, which in turn is expressed in degrees K. on the absolute scale. Color temperature is visual and is reckoned on this basis by comparison to a perfect radiator or "black body." As the temperature of such a body increases, there is at first no visible change. Ultimately, however, the body becomes dark red, bright red, orange, yellow, white, and finally blue at extremely high temperatures. Since a definite relationship exists between the color of an incandescent body and its temperature, the former is a suitable means for temperature measurement.

As a practical example of these considerations, suppose a perfect black body was heated to a temperature of 2927 C. and that the resultant color exactly matched an incandescent tungsten filament. By adding 273 degrees to the centigrade temperature to convert it to Kelvin temperature we obtain 3200 K., and this is the color temperature of the tungsten source.

Light Sources

The two most commonly employed artificial light sources for color films are the Photoflood lamps which operate at an approximate mean color temperature of 3400 K., and a second source operating at 3200 K. Number 1 Photoflood lamps are rated at about 3450 K., No. 2 at 3375 K., and No. 4 at 3360 K. when operated at their designated voltage.

Because the integral visual effect produced by a light source is a measure of its temperature, it does not necessarily follow that this is a complete description of the photographic effect of the source. One type of "white" fluorescent lamp, for example, is rated at 3500 K. but produces photographic effects entirely different from a tungsten source operating at the same color temperature. From a photographic standpoint, tungsten can be considered as a black body radiator, and accordingly, the color temperature of tungsten sources is a reliable indication of photographic effect.

Color Films

Color films for artificial light sources are specifically designed for use with the spectral distribution characteristics of one or the other of the two sources previously considered. Additional sources are frequently suggested, primarily as a means of extending the usefulness of the films. In such cases, compensating filters are recommended to adjust the color temperature to the correct level. Unfortunately, while making an effective color temperature adjustment, the filters cannot simultaneously adjust the light to the correct spectral quality, and it is this, rather than color temperature to which the emulsion responds. Generally speaking, the filters will supply an approach to the correct spectral quality, but not necessarily the complete attainment of it.

For best results, therefore, color films should only be used with the recommended light source for the particular type of film employed. When these sources are operated at the recommended voltage and used with approved types of reflectors, we will have a reasonably good guarantee that the spectral characteristics will coincide with those for which the film was designed.

abstract color slides

LOUISE HAZ

UDGING from entries in current color slide exhibits. color workers are increasing in almost astronomical numbers, photographically speaking. The entries in the Chicago 8th International reached over 1100 which means that

better than 4,000 slides were submitted.

Among this vast group of slide makers there must be many who were interested in trying new subject matter and color arrangements. Since color composition is basically the same as composition for monochrome, that is, colors instead of tones are brought together within the limits of the picture-plane to express emotions and ideas, it seems logical to assume that more emotion can be aroused by the use of color than by the use of black and white, at least in people who are not color blind.

In order to bring colors together pleasingly and successfully, one must have at least a rudimentary knowledge of what colors work well together. Therefore, the complementary or cold and warm colors should be memorized, the in-between shades as well as the three basic pairs, as these pairs when used together, not only complete each other to make white, but also "bring out the best in each

other."

To refresh your memory I will set down the fundamental pairs: Green and red . . . blue and orange . . . violet and yellow. These six colors fall into cold, warm and neutral categories. The terms "cold" and "warm" can be used synonymously with the term complementary, because the complementary of a cold red is a warm green, of the cold color blue the warm color orange, and of the cold color violet the warm yellow. Therefore, you cannot use complementary colors together without automatically using cold and warm colors together.

Due to the special way the eyes react when viewing colors, red enhances the color of green and vice versa, blue enhances the color of orange and vice versa, and violet enhances the color of yellow and vice versa. Add to this the knowledge that warm colors used side by side depress each other, and that cold colors used side by side depress each other, and you have the working knowledge necessary in making controlled color setups of the kind

to be described.

We all get tired of repeatedly using the same subject matter for our pictures. The general tendency should be not to specialize until one has first experimented and discovered one's aptitudes. I have found the composing of abstractions to be both educational and exciting. It is especially exciting when one can take ordinary things lying around the house and build a color picture with them. The culinary department is always a good place to start. Take a critical squint at the groceries as they come into the kitchen. How many picture-making items can come out of the grocery bag? Untold numbers, depending upon the imagination of the person choosing them. Take strawberries for instance, but not in the ordinary conventional

The slide, "Fenced In," was made by cutting a green pepper amidships and placing on it a slice of cabbage, and on that some strawberries. In my bureau drawer was a red belt with various colored wooden beads worked into it. This was arranged around the central group. Over this was placed a cake cooling rack. The whole setup was made on a soft green cardboard, its color chosen to keep it in the background where it belonged. The color arrangements used in this slide were the complementary pair red and green, which brings out the brilliance in each color.

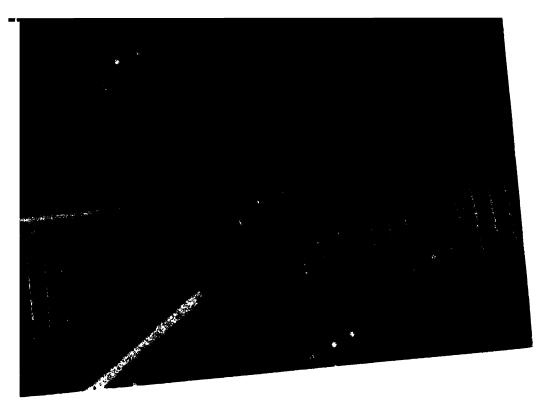

The slide, "Semi-Abstract," took me down in the basement to retrieve the family glass washboard. On my light box I arranged green and red pieces of cellophane, the green at the outer edges and the red in the middle. Over these I put the washboard. On the washboard over the green cellophane I placed red buttons with rose quartz beads glued to them, and over the red cellophane in the center I placed a soft green marble for a definite center of interest. Matches gave the finishing touch.

The slide, "Eggs in Abstract," came out of a box of eggs and a friend's chicken coop. To the eggs and feathers were added bubble gum, cayenne pepper and a blue paper picnic plate. The egg slices were placed on the blue plate over which was sprinkled some cayenne pepper to give depth to the blue background. On the center egg a blue and red ball of bubble gum was set to establish an unmistakable center of interest. On the other egg slices the bubble gum is blue.

For the slide, "Hoops My Dear," the light box was brought into use again and a piece of yellow corrugated transparent paper such as comes in candy boxes was put on it. Over the transparent paper was placed a portion of a carton which contained symmetrical holes for the purpose of packing merchandise; I think the articles had been Christmas bells. Two old embroidery hoops were found and some blue and green dots. The whole thing was put together to make a pattern.

MEET THE AUTHOR

Louise Haz, formerly a monochrome pictorialist and an illustrator of children's books, turned to color several years ago and won frequent acceptances, ribbons, and honorable mentions. Her slide, "Eggs in Abstract," recently was judged a gold-medal winner in the 8th Chicago International. Mrs. Haz has also had articles published in the December 1950 "Leica Magazine" and in the May 1951 issue of "American Photography." The wife of Nicholas Haz, FPSA, FRPS, she travels with Mr. Haz and assists him in his lectures on mistorial commenciation. his lectures on pictorial composition.

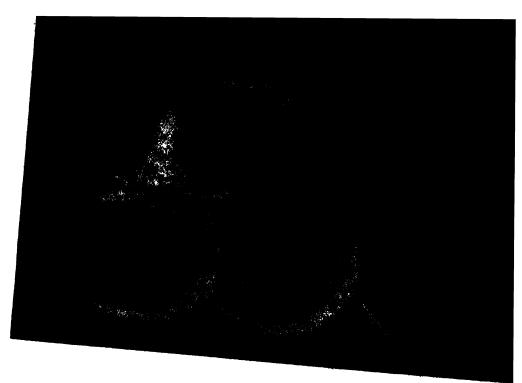

SEMI-ABSTRACT
LOUISE HAZ

Now let's sum up what materials were used to make these four slides: pink cardboard, red woven belt, green pepper, strawberries and cabbage, cake cooling rack, washboard, red cayenne pepper, cellophanes, marbles, buttons, matches, eggs, bubble gum, feathers, picnic plate, corrugated paper, packing cardboard, and embroidery hoops. To these, add the intangibles—imagination, color appeal, shape appeal and compositional appeal.

These objects were not used so as to appear recognizably as themselves but to create color spots of related sizes, shapes, and positions in order to produce a mood in the onlooker comparable to moods created by musical sounds. As a matter of fact, it is more or less desirable for the objects to be recognizable, thereby throwing the emphasis on the color, shape and line composition. Of course, the slides will not please everyone alike. Some people may

DOTS AND DASHES
LOUISE HAZ

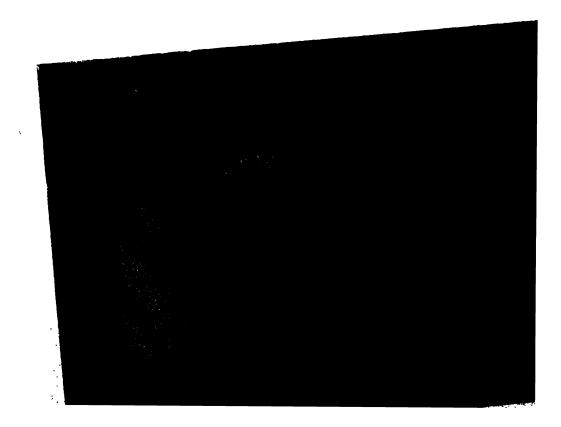

EGGS IN ABSTRACT Louise Haz

even dislike them, but that is in the nature of things and should not confound the slide maker. Therefore, the slides have no "meaning" in the usual sense of the word. The subject matter is not supposed to be examined or analysed and judgment pronounced on it. In an orchestral number one does not try to examine every note that is creating the composition.

In composing abstract slides, the end results are more

precisely the expression of the worker than the composing of ordinary subject material can ever be. In the latter the components are already before one's eyes and only the image arrangement need be considered. But in abstractions the materials must be gathered and their combinations thought out for suitability before they can be successful. Therefore, the challenge is greater in this type of photography and the achievement more gratifying.

FENCED IN LOUISE HAZ

Color Photography IS an Art

FLOYD A. LEWIS

NE OF the speakers at the recent PSA Detroit Convention remarked that he hoped photography eventually would be recognized as one of the arts. If this recognition does finally come (or, more properly, when it does), color slide photography will have had a large part in bringing it about, for this branch of photography has algeady progressed to the point where it is indeed a fine art.

Perhaps a few comparisons with painting will demonstrate the truth of this assertion, for this is the recognized art that color slide photography most closely approaches. Many painters still may shudder at the thought of any branch of photography being compared with their fine art; but if these artists will take the trouble to visit some of the international color slide exhibitions, they cannot help but be impressed with the genuine artistry represented by the successful entries.

Some painters have discovered the artistic possibilities of color slide photography by taking it up themselves. Some have come to use the newer medium as an adjunct to their own; others have become slide exhibitors and even exhibition judges.

Both painting and color slide photography have their great advantages as artistic media as well as their limitations. Some painters still maintain that whereas they must have a high order of creative skill to handle their colors properly, in color slide photography all that is necessary is to select a colorful subject, aim, and shoot; the film processor does the rest. Anyone who has gotten his feet wet in color slide photography of exhibition caliber knows the falsity of this assumption.

The slide photographer, of course, does not need to know how to mix oils or water colors and apply them to the canvas; but he must know just as much about the artistic fundamentals of color as the painter, if his results are to be color harmony and not discord or riot (unless the latter happens to be what he is striving for in some specific slide). He must know the capabilities and characteristics of his camera and color film just as the artist with the brush must know how to mix colors and how they will appear after they have been applied to the canvas and dried. The photographer must know too how to judge light conditions—what effects daylight of different quality will produce with a given subject; how to use artificial

light. Exposure problems are simplified by the use of a good meter, but here also the photographer must know how to interpret and apply what his meter tells him or the desired artistic effect may not be attained.

The color slide artist must know just as much about composition as the painter. In fact, a prominent color slide judge at one of the larger club competitions recently remarked that slides must now meet even higher standards of composition than paintings. He offered this comment while he was in the process of eliminating an attractive Western landscape slide, remarking that the composition was easily the equal of that in many paintings he had seen of similar subject matter.

Painters, of course, have complete freedom in the selection of subject matter and may assume any desired point of view. Any unwanted objects or details are simply not recorded on the canvas. Often such objects or details will ruin an otherwise prize-winning slide, and here is where the slide photographer's special artistry comes into play. First he will try different points of view. Sometimes the offending element can very easily be screened out behind some wanted element. Sometimes it is necessary to do a contortionist act to get the right angle. When even this won't do, the photographer must wait until the light conditions are such that the offending element appears less prominently.

This technique on the part of the photographer is just as much creative artistry as the painter's selection of objects that he puts on his canvas, for in both cases the final scene must be visualized by the artist, be he painter or photographer.

Once the slide photographer has carefully selected and arranged his subject matter, placed his camera at the proper point to give him a pleasing composition, evaluated the light conditions (or adjusted his lights if working with artificial sources), focused to give the desired depth of field, determined the proper exposure, and set his shutter to admit enough light to produce the effect he has visualized on the type of film he is using—then finally is he ready to click the shutter. Assuming that his evaluation of all the variable factors has been correct, the infinitely greater capabilities of his medium will give him a result that cannot be matched in painting—a result that is truly artistic in its own right.

How Should Color Slides Be Judged?

ARTHUR W. PAPKE

PRACTICAL and common sense system of color slide evaluation that can be universally acceptable seems to be an important necessity in the present day life of the worker and exhibitor in color slide photography. An exhibitor may send a color slide to several exhibitions in different sections of the country with varying results; acceptances here, rejections there. Just what does this mean? Is the slide any good, or is it worthless for exhibition purposes?

This brings up a natural question in the mind of the exhibitor. Are the judges competent and qualified? Or are the selections of the judges merely expressions of their personal preferences, prejudices, likes or dislikes? More likely the judges were not provided with a suitable

scoring system.

The methods of selection or scoring are few indeed. The major systems in common usage are the "in or out" method, the green and red light electrical scoring device, and the numerical or decimal system.

Each of the major systems has its advantages and disadvantages. The "in-or-out" is simple in its operation, but is a cold proposition. The result, particularly a negative one, leaves the contestant without an adequate evaluation of his slide. The green and red light system, sometimes with the addition of an amber light incorporated in an efficient electrical device, is much more rapid in its operation than the in-or-out method. Many contest and exhibition committees translate the green, amber, and red lights to numerical values, usually 5-3-1, or 5-3-0 respectively. Two lights, green and red only, afford little benefit over the "in-or-out" method. An amber light added to the green and red immediately provides another degree of value, and the value levels increase progressively as the number of judges increases.

This affords the exhibitor some idea as to the relative merit of his slide in competitions using this type of scoring system. But the fly in the ointment is that there is no universal definition of what constitutes a green light value in a color slide—here, there, or anywhere. The difficulty is in drawing a line or setting a point at which the value of the various elements in a color slide should raise the light value from red to amber, or to green. This, of necessity, must be a rather broad definition and most

likely will be loosely interpreted.

Another method in common use is the so-called numerical or decimal system, using the 1 to 10 scale. This affords several degrees of values, which is much better than any of the other systems. In addition, it affords the possibilities of universal acceptance for comparative purposes in competitions or exhibitions anywhere geographically. Much like the other systems, the picking of a number from one to ten is based largely upon a guess at the numerical value. Furthermore, it is my observation that the estimate or guess varies geographically. Like the light system previously mentioned, there is no universal definition of point values assigned to the various elements of photography in a color slide.

Variations of these major systems are evident here and there. Some are practical inasmuch as they serve a specific purpose, others appear to be in an experimental stage.

It is obvious that the advantage of the numerical or decimal system lies in the wide range of values available in the evaluation of a color slide. Yet no particular progress has been made in any standardization of point values for the various factors to be considered in any evaluation that

could be universally acceptable.

Any standard of point values for the purposes of evaluation must, of necessity, be practical and convenient, easily remembered, and administered by the average amateur as well as those at the top level of photography. With this requirement as a guide, it is essential that a spread of point values for the various factors in a color slide be simple and with some semblance of organization. The range of point values suggested herein is in keeping with this line of thought. It is at variance with the thoughts of others on this subject and perhaps may be controversial.

The point values on the well known one-to-ten scale are simply stated in this condensed form:

Camera Technique	2 p	oint
Composition— Color	2	"
Linear	2	**
Interest Value	Á	**

Arthur W. Papke, in addition to being president of Chicago Color Camera Club, is one of the world's leading slide-makers. In the 1950-51 year he attained 85 acceptances in 31 recognized exhibitions—an average of almost three slides per show. He holds two PSA medals for color harmony; and has won four trophies, seven other medals, and 44 ribbons for his color work.

In this system, camera technique is given consideration first. The ability of the photographer in the handling of his camera through the manipulation of focus and exposure are usually obvious. The elements of focus, sharpness and definition, in their effective relationship to the subject matter, is worth a point. The element of exposure includes the effective use of aperture and shutter speed, and this, well done, is worth a point. Exposure and focus, the backbone of camera technique, is fundamental. Any color photograph which does not indicate satisfactory handling of these fundamentals is not worth two hoots. Without a major value in this department, there is no starting point for further consideration of point values for the elements of composition and interest.

The next major factor in evaluation is the composition of subject matter. This is more complicated in color than in black and white, because the expression of harmony in color combinations can be as varied as the human race. We know, or rather feel, through a sense of good taste, that certain shades or hues of colors effectively complement or contrast with others, and this serves as a guide in our evaluation. Ostwald, in his research on the arrangement of color, attempted to reduce color to a mathematical science. The use of a scale, such as Ostwald's, is impractical. We must rely largely upon the judgment of the evaluator. The values for the effective use of color are set at a maximum of two points.

The other major component of composition is linear, the arrangement of lines and form, and the dominance of subject matter or material. There are many phases of composition to be considered, and it is not the purpose of the author, at this time, to make an exhaustive breakdown of this element. Again we rely on the judgment of the evaluator in awarding a maximum of two points for the effective use of linear composition.

The elements of camera technique, color composition, and linear composition are given a maximum of six points in this system of point values. These are the elements largely involved in the overall technique in the assembly of a color slide.

The remaining element in the evaluation of a color slide is its interest value. Within this category there are many variable factors and problems to be considered. In-

terest value, in very simple terms, is the degree of mental excitement aroused by the subject matter and its arrangement. A discussion of the various factors in interest value could become quite complex and involved. The degree of mental excitement may be caused by any one of several factors, such as appeal, significance, originality, ingenuity, mood, and so on. The values of any one of these factors could and do vary from picture to picture, and it would be most difficult, if not impossible, to define any of these intangible factors and place a numerical value on each.

Further, we have the problem of the mental attitude, preferences, and prejudices of the individuals charged with the responsibility of placing a fair value on any of the elements in a color slide. There is no common ground on which to stand.

With these variable factors in mind, and in keeping with the intent in keeping the method of evaluation on a simple and practical basis, the values placed on interest value, using common everyday terminology, would then be as follows:

Terrific	4	points
Excellent	3	•
Good	2	**
Hair	1	**

The maximum values on the four major elements of a color slide add up to ten points, the full range of the one-to-ten scale. The method of computing points is relatively easy and rapid with this simple organization of the four major elements. Some may prefer to add all the points, or fractions of points, for each of the major elements, while others may prefer to discount or deduct points or fractions thereof for obvious defects, deficiencies, or imperfections in the slide from the maximum point values of the first three major elements, and then add the points for interest value. Decimals may be used instead of fractions, if deemed convenient, but for ease in voting or recording values, decimals should not be used in the final total.

The objective in this discussion of evaluation of a color slide is eventually to set up some standard or practical basis for point values which will be understandable and universally acceptable. This should help greatly to minimize much guess work and inconsistent evaluations.

THATCHED COTTAGES, WELFORD ON AVON

W. J. Linbird

Colour Photography in England

W. J. Linbird

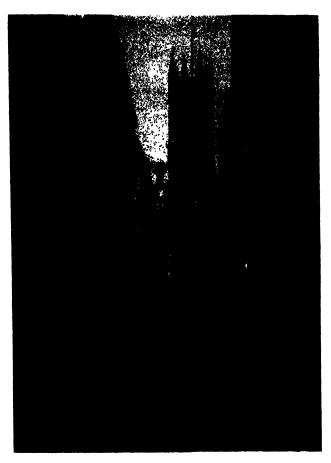

DUE TO the war years and subsequent government restrictions on manufacture of luxury articles, there has been little advance in colour photography in Great Britain during the past twelve years. As far as the amateur is concerned, his means of expression in colour remains in the transparency alone or the laborious three colour carbon (carbro) with its separation negatives.

The market has been monopolized by Kodachrome but Ilford Colour, now greatly improved, bids to challenge this supremacy. This challenge is materially assisted by the considerable difference in cost of approximately 25%.

The new Ilford Colour film is available in 35mm form only, packed in daylight loading cassettes containing sufficient film for 20 exposures 24 x 36mm size. Two types of film have been introduced, namely "D" and "A". Type "D" is intended for use in daylight without a filter but may be used with photoflood lamps and a No.351 filter.

When photographing distant landscapes, beach scenes and scenes at high altitudes with bright blue sky, the Ilford Q filter may improve colour rendering. Type "A" is for exposures with artificial light without filter but may be used in daylight with the Ilford 161 filter. Since ultraviolet is absorbed by this filter, the Q filter is not necessary when photographing at high altitudes, etc. The recommended meter settings for both films, when used without a filter, is Weston 8. Both films are of the subtractive type. The colour couplers which produce the dyes are not incorporated with the emulsions at the time of manufacture. The films must be returned to the makers for processing.

Dufaycolor is the one colour roll film obtainable here which may be home processed. It also differs in that it is supplied in roll film sizes No.27, No.120 and No.116, as well as 35mm. It is an additive process, consisting of

ST. MARY'S CHURCH, WARWICK

W. J. Linbird

a reseau made up of about one million colour elements per square inch, over which the sensitive emulsion is coated, the film subsequently being reversed to a positive during processing. It is viewed as a transparency only, there being no colour print process available. The transparencies do not, it must be admitted, project as brilliantly as Ilford Colour or Kodachrome, but the prices are reasonable and within the reach of all amateurs' pockets. For example, an 18-exposure refill for the 35mm cassette sells at 5/9d. (81c)—nearly one fifth the price of Kodachrome and under one third the price of Ilford Colour. The popular 120 size costs only 8/9d. (\$1.22) and processing, if required, is priced at 1/9d. (24c) per spool, regardless of size.

A newcomer to this market is Agfacolor negative film from which prints in either medium, monochrome or colour, can be produced. Admittedly, the film itself and the colour prints, can be processed only by the manufacturer but it arouses a spark of hope in the minds of all colour workers. Monochrome prints show excellent quality, but from what has been seen of the colour prints produced in this country, it is thought that they were not up to the German standard. Agfa are aware of this, the process is having teething troubles, and difficulty is being experienced in getting really satisfactory quality in the enlargements. German technicians are now in this country, correcting the faults made in the British stations, and there can be no doubt that a marked improvement will be noted in the near future. The chief difficulty appears to be in getting a "pillar-box" red. All reds have a

brownish appearance in the prints, a defect which applies to the prints made in the German factories as well as those made over here. It is marketed in the popular 120, 35mm Leica and Karat sizes. The Leica 20-exposure film costs 25/- (\$3.50), including processing. Prints are an extra charge; for example, the cost of one $2\frac{1}{2}$ " x $3\frac{1}{2}$ " colour print is 3/- (42c) or one $7\frac{1}{8}$ " x $9\frac{1}{2}$ " is $2\frac{3}{6}$ d. (\$3.29).

Kodachrome, which has long been the favourite miniature film for amateur colour workers in this country, will need no introduction to the reader. Its shortcoming, to the amateur mind, like its competitors already mentioned, is that processing must be done by the manufacturer. Many workers in this medium maintain that films sent to America for processing prove immeasurably better than those processed in England. From examples seen, this statement seems justified. Perhaps the fact that American stations process many thousands more than their English counterpart may have a bearing. Ektachrome, of course, may be home processed but since this is in supply only as cut film it is not very popular. When colour printing processes are available to the British amateur, it will doubtless come into its own, but while transparencies hold the sway, the miniature slide, with its ease of handling and projection, occupy the stage.

Ansco Color cannot really be said to be on the market here; supplies are so small as to be to all intents nonexistent. Here again, amateur processing has proved superior to that done by the trade.

Afterwork on the transparency, apart from dye spotting, is little practiced. Although there are a few workers who claim that their explorations into that field have been worth while, the fact remains that colour correcting (dye reducing) by after bath is an unpredictable business.

Visitors to these shores are advised to bring with them supplies of their favourite colour material. Supplies here fluctuate according to prevailing restrictions and it is often almost impossible to obtain colour films.

There are so many beauty spots that it would be impossible to describe them within this article. Furthermore, abbeys, castles, cathedrals, cottages and mansion houses so abound in every county that it becomes difficult to select an area that is outstanding. Personal preference must guide the choice. One thing is certain, no matter what the visiting photographer's taste, it will be satisfied. Messrs. Ward Lock Co., Ltd., have published over 100 Guide Books, which cover the British Isles section by section, and from these you can learn all the interesting details of the districts covered by your itinerary.

In his edition of "The King's England" covering Warwickshire, Arthur Mee writes of its county town, Warwick. Let us see what it has to offer the photographer: "The tale it tells is as old as the tale of England. The preservation of the past is singularly complete. Its castle, its great church, its ancient hospital, its gates, its monuments retain the source of antiquity and nature's setting perfects the picture." Beautifully put, but how very true! Warwick, in close proximity to the Cotswolds and Shakespeare's country, can be made a centre of absorbing interest to the visitor that time will pass on wings of flight. The castle alone may take a day to view, digest, and photograph. To quote Sir Walter Scott, it is "the fairest monument of ancient chivalrous splendour which yet remains uninjured by time."

Certain parts of the castle may be visited between 10 A.M. and 5:30 P.M. Tickets (2/6d.-35c) must be obtained from No.1 Mill Street, opposite the Castle Lodge. A nominal charge of sixpence is made for photography in the castle grounds. The Armoury contains one of the finest collections of ancient and mediaeval arms and armour in this country. Gathered from all over the world, some display beautiful Oriental workmanship and others were actually worn by defenders of the castle. It has, of course, its haunted room—known as Sir Fulke Grenville's room, containing portraits of Sir Fulke and of Oliver Cromwell, beside which is Cromwell's death mask.

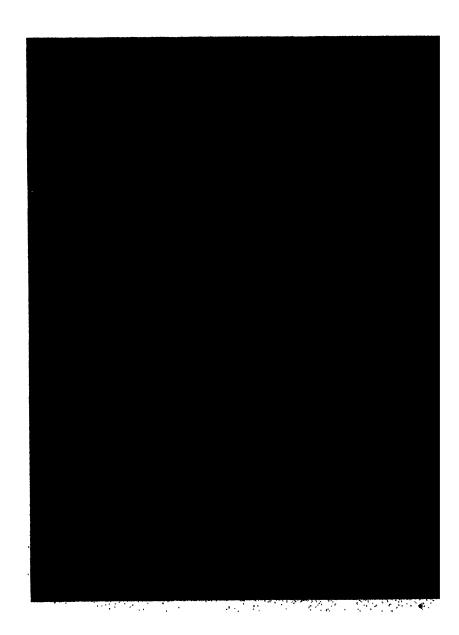

The State rooms, beautifully decorated with tapestries and damask and with exquisite carvings, contain many notable pictures by such artists as Madame Le Brun, Holbein, Kneller, Lely, Rubens and Vandyck.

In the garden, one finds the Greenhouse, built to contain and exhibit the Warwick Vase. The Vase, composed of white marble, is circular in shape and will hold 136 gallons. The work is attributed to Lysippus of Sicyon, a Greek artist who flourished at the close of the fourth century B. C.

From the top of the great tower of St. Mary's Church may be seen the country tramped by Shakespeare, much of it now as he saw it then. It is a handsome church, light and spacious, and amongst its treasures is one of England's most famous places, The Beauchamp Chapel. Here lies Richard Beauchamp, the man who stood for England at the burning of Joan of Arc. He saw three kings on the English throne. Beauchamp Chapel, crammed with glory from floor to roof, has 32 canopied niches, in which stand the Beauchamps, all with their coats-of-arms, with angels between them, an impressive gallery of golden figures, fashioned in an age when craftsmen were artists indeed.

Leycester Hospital stands by the West Gate of Warwick, from whose balcony can be seen a vision of the Cotswold Hills. Built for religion early in the fifteenth century, it was made a hospital by Robert Dudley, Earl of Warwick, in 1571. Its kitchen, which contains the wardrobe Queen Elizabeth used at Kenilworth, its banqueting hall, where Fulke Grenville entertained King James, and its tiny courtyard with dozens of heraldic crests, will enthrall the visitor.

These three, monuments of the past, set in a countryside of surpassing beauty with old world villages and mansion houses, are but a small part of British heritage. So few words of description cannot have done justice to the many many hours of pleasure spent wandering with camera around their precincts.

A WARWICK LANE
W. J. Linbird

SPEEDLIGHT - Exposure and Development*

Andrew F. Henninger

HE EMULSION behavior of both pan and color films is different when exposed by speedlight than with daylight, tungsten lamps, or flashbulbs.

This is due to the differences in the characteristics of the light produced by electronic flash. Speedlight differs from other light sources in one, or more, of the follow-

ing respects:

1. High intensity Short duration

Spectral characteristics.

To obtain an idea of the extreme brilliance of a speedlight flash, consider how many high-wattage tungsten lamps are required to enable an exposure to be made at 1/50th second and a diaphragm setting of f/6.3. Now consider a small speedlight providing the same degree of exposure at 1/10,000th second at f/16. Obviously, the intensity of the light is far greater than that provided by the sun or artificial sources in common usage.

The high intensity of speedlight undoubtedly accounts for the interesting and unusual characteristics of pictures taken with this light source. Users consistently report that they obtain perfect detail in light objects without the customary blocking up, and yet get excellent rendition of dark objects. Others mention the unusual shadow detail when only one light is used and the surprising carrying power of the light for the exposure of distant objects.

The reaction of the film to the immense brilliancy of a speedlight flash is responsible for these unusual effects. With light of lower intensity, the emulsion will ordinarily respond in proportion to the amount of light applied. This could be called the optimum exposure, at which the film emulsion is most efficient. When this optimum exposure is exceeded and an excessive amount of light quanta strikes the emulsion, the areas receiving most light, as reflected from lighter objects, do not give full response for the amount of light received. The emulsion areas that receive a lesser amount of light, as reflected from darker objects or shadowed portions, are responding at a greater rate. This results in a negative with less density range between highlights and shadows and one more capable of being reproduced by present enlarging papers. The subject is depicted more nearly as actually seen by the eye.

Indoor portraits made with one flashtube, frequently surprise the maker because of the exceptional amount of

shadow detail. While the film response effect previously described helps considerably, the higher light intensity produced by electronic flash aids materially in another manner. There is a substantial reduction in light intensity each time it is reflected from walls and ceiling. By starting this series of reflections with a light of higher intensity, it is capable of being reflected more times before diminishing to a degree where the film will no longer respond. Some additional shadow illumination is obtained with each reflection and the cumulative effect helps appreciably in building up an image in the shadowed portion.

The speed relationship of the various types of films, even those made by the same manufacturer, vary considerably in their response to the short duration flash provided by speedlight. As an example, consider the performance of Ansco films, Superpan Press (ASA 100) and Isopan (ASA 50). With exposures of 1/50th to 1/1000th second, Superpan Press has practically double the speed of Isopan, as would be expected by a comparison of their ASA rating.

When exposed by speedlight, with its brief duration flash, Superpan Press has proportionately less response than Isopan, with the end result that a comparison of the relative speeds of the two films show them almost equal, or perhaps slightly in favor of Isopan. The excellent fine grain characteristics of this latter film and its susceptibility to extended development without tendency to fog, make it a desirable emulsion for speedlight use.

Certain films of the various manufacturers have this special trait of responding advantageously to speedlight. Some of them are:

About the Author

Andrew F. Henninger, President of AMGLO Corporation, pioneer manufacturer of flashtubes and speedlight equipment, has to his credit more than 30 patents on gaseous conduction lamps and circuits.

An electronic engineer of international repute, his avocation is research and development in the fields of photographic lighting, radio tubes, and radiations outside the visible spectrum.

Mr. Henninger has been an avid photographic hobbiest since

the age of twelve. He is a contributing editor to "American Photography," a member of PSA, and of the Green Briar Camera Club of Chicago.

^{*} The accompanying article is from one of the chapters of the forthcoming book by Andrew F. Henninger, SPEEDLIGHT—THE COMPLETE BOOK ON ELECTRONIC FLASH. It is scheduled for publication early in 1952 by American Photographic Publishing Company.

While the ASA film speed remains remarkably constant when given the longer duration exposures, we do know that the response of the various types of film to speedlight illumination is different because of varying degrees of reciprocity failure. Stated in another way—the effect of light on certain film types is considerably less than would be expected for the amount of light provided, when it is applied for exceedingly brief periods,

Another factor affecting film response in a different manner is the differences in spectral characteristics of speedlight illumination as compared to incandescent lamps

and flashbulbs.

The latter two sources are strong in the red, orange, and yellow portions of the spectrum and comparatively weak in the green, blue, violet portions. Electronic flash provides a light of much higher effective color temperature with an abundance of strength in all colors, quite similar in color balance to average daylight.

This comparatively greater strength in the green, blue, violet spectral portions, tends to produce negatives of lesser contrast, which are much on the order of the soft portrait effects obtained when photographing a subject out of the direct rays of the sun, with the only illuminant being reflected light from the sky.

Increased development time is considered the best procedure to increase contrast, as an appreciable gain in film speed is also obtained. The major film companies and most individual experimenters have settled on a 50 per cent extension in time of development as the correct amount.

This provides a degree of contrast comparable to that obtained in negatives exposed by other light sources and

given listed development time.

For speedlight, the more energetic developers are recommended (Eastman DK-60a and DK-50 and Ansco Permadol). When using some of the slower acting, fine grain developers, the development time should be prolonged still further, in order to accomplish the same result.

Remember, these are not inflexible procedures. They can be varied considerably to suit subject matter, equipment, and processing materials. For example, users of small film sizes may prefer using one of the less energetic, fine-grain developers and would also like to avoid excessively long development time. In this case a compromise is in order. By extending development time only one-third, but giving much fuller exposure to compensate, very satisfactory results will be obtained.

It is difficult to provide speedlight guide numbers when only the energy input to the flashtube is known. In addition to the possible variables, the user might encounter with different types of film, developers, and processing technique, flashtube and reflector efficiency must also be considered. Total variations of several hundred per cent have been encountered with different types of these

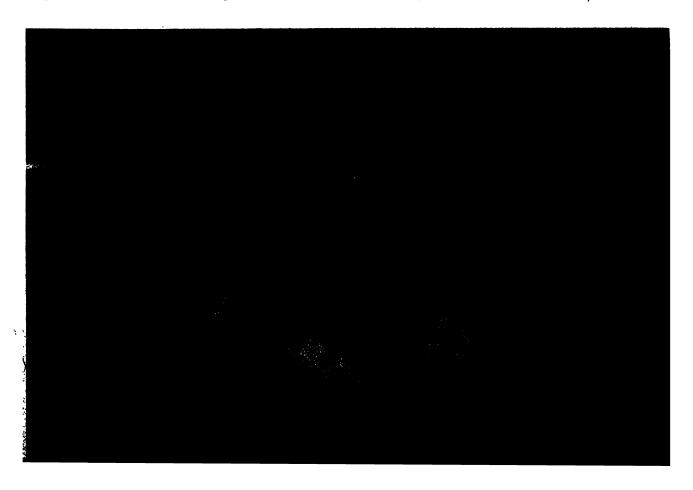

components.

When guide numbers are given and all these unknown variables are involved, a strict literal interpretation of the word "guide" should be followed. It is a guide—nothing more, and should be merely used as a basis for making test exposures to determine the proper number to be used with the exact materials and processing methods

employed.

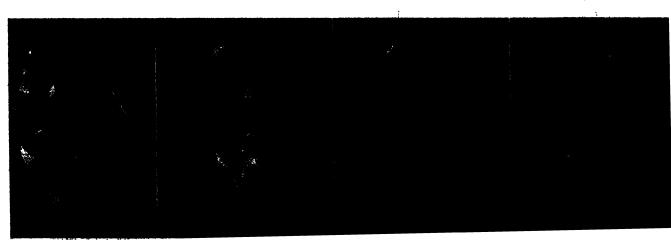

The above comments apply to the following Ansco and Eastman tables. While specific recommendations are provided concerning film, developer, and development time, there remain the two unknown factors of flashtube and reflector efficiency. However, with the number of uncertainties reduced, the listed guide numbers become proportionately more accurate, and in many cases will be quite close to the final numbers established by actual tests.

Michael Shuter of Brooklyn turns out quantities of these striking speedlight child studies with a 3½ x 4½ Speed Graphic. He concentrates solely on expression, as speedlight will successfully handle any subject motion. All photographic illustrations were prize winners in Amglo Speedlight Contests.

Sequence portraits and speedlight go hand in hand. Noted television comedian, Joe E. Lewis, tells a story, while Dave Robbins,

ANSCO TABLE A—EXPOSURE GUIDE NUMBERS FOR SPEEDLIGHT

		Watt-sec	ond Lar	np Inpu	t
	50	100	150	225	400
SHEET FILM		. 4,		,	•
Triple S Pan	135	180	240	300	390
Superpan Press	110	150	200	250	325
Isopan	110	150	200	250	325
Superpan Portrait	95	125	170	210	270
Triple S Ortho	110	150	200	250	325
ROLL, PACK AND 35 M	M				
Ultra-Speed Pan	110	145	190	240	310
Superpan Press	110	145	190	240	310
Supreme	110	145	190	240	310

The use of listed guide numbers in Ansco Table A is dependent on the employment of the developer and development time listed in Table B.

A series of portrait negatives was made using each of the Kodak sheet films listed below. These films were exposed by a fixed electronic flash light source and developed to approximately equal printing contrast to give speedlight exposure ratios on Kodak sheet films. The following table shows the lens apertures required to produce the negatives in this series and as a guide to the relative speed by electronic flash.

Film	F stop
Tri-X Pan	f/18
Super Panchro-Press Type B	f/16
Super-XX	f/14
Portrait Pan	f/8
Panatomic-X	£/7
Ortho X	f/14
Super Ortho Press	f/10

The comparatively slow speed of color film and the restrictions in regard to developers and processing times combine to reduce speedlight guide numbers to a low figure. The user of a low power speedlight must accept this situation with resignation and be content to place the lights close to subject and to employ the large f/stop openings.

Daylight type color film is now universally recommended for speedlight use because the color quality of the light is very similar to average daylight. Tungsten-type films may also be used. Because of the relatively dense filter requirements needed to change the color quality of the light to match the film, the effective film speed is considerably reduced.

The speed and color balance of color film may vary

slightly with different emulsion numbers. When using film of a different emulsion number than that previously used, it may be necessary to make slight exposure corrections and also to employ moderate changes in color correction filters. For this reason it is a good plan to purchase as much film of one emulsion number as is estimated will be used before the expiration date. Any necessary testing for both color correction and exposure is thus kept to a minimum.

As a general rule, the film speed will be reasonably close to its rating. Very rarely will a given emulsion number require more than normal exposure. More frequently, the film will be faster than average, the maximum variation ranging up to a half stop. With some film, information is enclosed in the package, giving any necessary changes in speed rating to provide normal exposure and also the manufacturer's recommendations concerning the proper filter to use with speedlight to provide normal color balance. Before shipment each group of film carrying a given emulsion number has been tested for both speed and color balance, when used with electronic flash.

The range of color balance variations may extend from exact suitability for electronic flash, without color correction filters, to balance for light of slightly lower color temperature. Film in the latter range requires the use of color compensating filters, very lightly tinted with colors in the red, orange, or yellow portions of the spectrum. These have the effect of holding back a slight amount of light in the blue portion of the spectrum, lowering the effective color temperature of the light the 100, 200, or more degrees Kelvin, as required. Only slight exposure increases are needed with these filters as the coloring is not of sufficient density to block more than a very small portion of the total light provided.

Some users, when photographing human subjects, prefer to over-correct slightly, in order to obtain more ruddy skin tones. When the film is already correctly balanced for speedlight, a UV filter will frequently be adequate for this purpose. This filter has the effect of holding back a very slight amount of blue and violet visible light and practically all of the invisible light in the near ultra violet band, produced in limited amounts by most flashtubes. Few types of flashtubes will emit energy in the middle and far ultra violet bands, unless both spiral and envelope are made of quartz or Vicor glass. Most in general usage are made of the type of glass belonging to the Pyrex group, which does not permit passage of ultra violet in the middle and far bands.

Revised guide numbers and filtrations for high speed electronic flash with Ansco Color are as follows:

REVISED RECOMMENDATIONS ANSCO COLOR FILM WITH ELECTRONIC FLASH

				Filtra	tio	n	Guide Numbers
Daylight, 2	35, 635			ŪV-	16		40*
Tungsten,		•		Conv.	. 1	1	40*

*To convert to other watt-second rating, use the following multiplying factors:

Watt-second Rating		Conversion Factor	•
 	-		
25		.3	
50		.45	
100		.6	
150		.8	
225		1.0	
400		1.2	
900		2.0	

** This combination does not produce as satisfactory a result as the daylight type. The Conversion #12 filter is no longer recommended.

For users of Kodachrome and Ektachrome daylight color films, who prefer to work with a minimum of correction filters, Kodak Color Compensating Filter 81B would be a good choice. For those requiring more accurate color balance, filters 81, 81A, CC10Y and CC05R, or the equivalent in other makes, could be added. For very exacting work, filters 1A, CC05G and CC05Y may be included in the list.

When using Ansco and Ektachrome color films, special processing by the user offers another method of correcting color balance without the use of filters. This system, very fortunately, also has the effect of increasing film speed from 25 to 100 per cent. An appreciable increase in magenta is obtained by extending the time of first development. The exact time must be determined by "trial and error," as it depends upon the color balance of the particular film used. Usually two to four minutes time increase will provide the desired effect, though much longer times have been successfuly employed. Time in the last developer is also susceptible to manipulation; one or two minutes less development than listed having a noticeable effect. Remarkable results have been obtained by combining both development changes.

When employing a processing technique which is at variance with the film manufacturer's recommendations, it must be understood that the experimenter is "on his own" as far as results are concerned. Naturally, no claim should be made to the manufacturer, or others, for unsuccessful experiments.

STORY TELLING

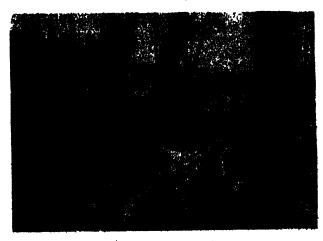

M UCH EMPHASIS is laid on the single slide, story-telling picture. That's the one that delivers a message, the one that has appeal. Many of us, however, who have good slides of related subject material and continuity, have failed to show those slides we have made in trying to get the one exhibition shot.

In our educational program we encounter the textbook which evaluates facts of learning; history books which record the events in the progress or regression of nations; biographies and novels which allow the reader to be enlightened, amused or carried away with the author's motivation.

In color slide work, we have been working for, and will continue to strive for, that one shot that will tell its story, have a vital center of interest and leave the viewer with a startling memory. However, many of us in our attempt for that one successful shot, have taken two, three or many more pictures of the same subject, with a similar background. With these similar backgrounds, the characters are the same, but the action develops and progresses in each slide.

One color worker recently showed a sequence of six pictures of a Mexican fiesta. He was afraid to be seen on the street with his camera as he was a tourist and he knew he'd be very obvious among the native people. From an open balcony he got some street scenes, but his best shots were from an open window in his hotel room, making use of various focal length lenses. How many exposures he made to get his story in six pictures, I don't know, but his audience was thrilled by the color, the setting, the activity and feeling portrayed. All movement was climaxed in the two final pictures, which were close-ups of the two

Swordfishing schooner leaving Gloucester Harbor. The course is southeast by east to the fishing banks.

PSA JOURNAL, Vol. 18, Mar. 1952

with COLOR SLIDES

DR. RICHARD B. POMEROY

top dancers, depicting life and joy in their faces and brilliance in their costumes and make-up.

As the textbook and the story book are developed chapter by chapter, each paragraph contributes its story-telling point. Sometimes we find a story complete in one paragraph, like the one 'Award' shot. But, often, we can't achieve the impression of action or story with one picture, and we have to have a series to develop the sequence of action. The books we read are composed of many paragraphs to make a complete chapter which usually has a suggested title that gives the reader a background impression of correlated facts.

When our series of slides ties in with a sequence of events with a similar background, we have the framework for a story. For example, I made a series of sixteen pictures of a barn burning. The background remained the same, but each shot recorded the action from the arrival of the fire apparatus to the smouldering embers. One of the slides, "Total Loss," which climaxed the action, proved the most successful record picture I ever made. Yet, even with this one picture out on exhibition the remaining group still reveals a complete, horrible drama.

One of the most effective ways for grouping slides in sequence is a series of how it is done. You may say, "Oh! That's been done before," and you hear judges make that remark at contests. Regardless of who has done it before or how it was done, you know your own camera best. You look at the subject material with your own eyes, you study the situation, you become inspired and you take the picture and make a duplicate (just in case). Follow your inspiration by taking pictures up to the climax and then take a few more to a definite conclusion, to tell your story.

On the alert. The barpooner is ready to thrust the barpoon into the pwordfish.

PSA JOURNAL, Vol. 18, Mar. 1952

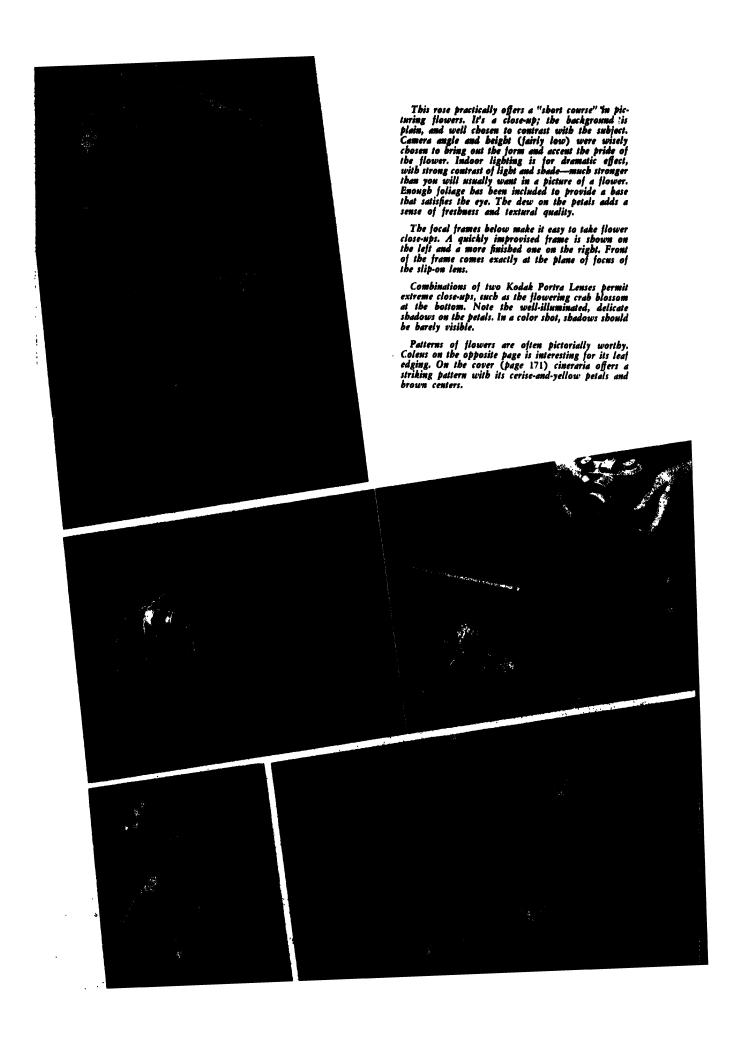

A 250 pound fish lying in the dory. Note that no water entered the dory as the fish was rolled into it.

This procedure is the recording of a sequence and you alone know best how that series should be shown. It's the personal interpretation that you want and develop that makes your slide story different.

Then there are the documentary, historical, scientific sequences, etc. The possibilities of poetic series are limitless-poems of fog, mists, sunset and pastoral scenes. Fantasy is just being explored in abstracts, designs, line formations and even double exposures. One of the most effective sequences I've seen lately, consisted of three slides of the "line formation type." With a flare toward the modern the maker showed a vertical frame with a simple, slightly diagonal line, a cable with a hook on the end. The cable and hook were silhouetted against a vivid blue sky. The second picture was a vertical, showing the derrick boom at another diagonal with the cable and hook in a lower position. The third picture was a horizontal frame showing horizontal and vertical lines of a steel structure also silhouetted with the derrick and boom pleasingly placed to show how the steel girders got into position and how they formed the framework of a new building.

These are just a few ideas which can tempt a photographer to tell stories with his camera and bring animation into a series, as well as just take pictures. It is the blending or arranging of a set of slides, or a series of various named groups, that gives a story the punch of high audience reaction.

PICTURING FLOWERS*

STEP OUT into your flower garden, and select one perfect bloom. Before you pluck it, view it from different positions and at different levels—down low, up high. At each position, observe the form of the flower; consider both its outlines and the angle at which the sun strikes it. Rotate the flower in relation to the sun; you'll find one

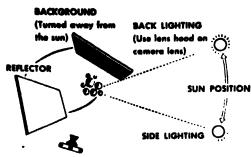

* Reprinted by special permission from "How To Make Good Pictures" by Eastman Kodak Co., Rochester, New York.

position in which the pattern of light and shadow best reveals the sculptural form. Observe the background; from some viewpoints it will be spotty and confused. Try placing a plain background of white, black, or tinted cardboard behind the flower, and observe its effect.

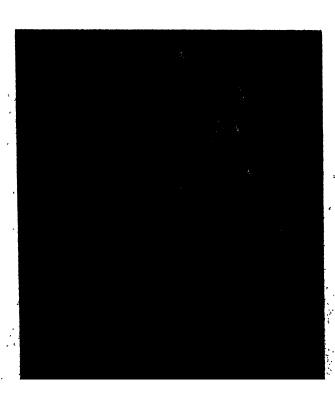

You see, picturing a flower is something like making a portrait of a person. In a sense, you're trying to bring out the personality of the flower, as well as obtain an

A bandy setup for pictures of flowers. Cardboard background blocks out irksome details. Note its use in pictures of tulips at top and iris at bottom.

attractive likeness. Snapping the picture is just the last stage; it's the preliminary steps that count—the selection of subject, lighting, viewpoint, camera distance, and back—reground.

There's Fascination in It

Whether you work in full color or black-and-white, flower photography provides one of the most fascinating among the many camera specialties. Some enthusiasts concentrate on single blooms . . . others enjoy picturing small groups, or flower arrangements, with occasional pictures of the entire garden or a particularly attractive border or corner.

Your equipment is simple: a camera, one or two Kodak Portra Lenses, and a Kodak color film (or, a Kodak Wratten K-2 Filter and a Kodak panchromatic film).

Panchromatic film is best for black-and-white shots, because it is sensitive to all colors; on most other films, red flowers tend to record as black, and blue flowers tend to be relatively pale. Use a panchromatic film, with a K-2 Filter over the camera lens, and the black-and-white "tone values" in a group of flowers (or any other brightly colored subject) will appear in a more natural relationship.

For full color, Kodachrome Film or Kodacolor Film is a natural choice. A Kodak Pola-Screen can be used over the camera lens when there is blue sky behind the flower, and you want to record it as a richer blue.

Portra Lenses for Real Close-ups

The average camera does not focus for extreme close ranges; but if you set it at "infinity," and put a 3 + Portra Lens over the camera lens, you can bring the camera to just 13 inches from a flower; and if you set the camera for 3½ feet, the taking distance can be only 10 inches! The 2+ Portra Lens provides a range of about 13 to 21 inches, and the 1+ a range of about 20 to 45 inches. (Each lens is supplied with a sheet of exact instructions, distances, and field sizes; don't lose it!)

These handy little lenses make a tremendous difference when you picture a flower or any other small subject—especially if you make pictures in color, for screen projection. Imagine picturing a single rose in close-up, and then showing it in full color, four or five feet wide, on a projection screen!

Reflectors for Flower Portraits

Soft lighting and plain backgrounds are desirable in flower portraits. The wise photographer will equip himself with several sheets of cardboard or thin wood (about the size of a newspaper page)—some white, for reflectors or light backgrounds; some dull black, for dark backgrounds; and some in color, with at least one a rich sky blue. These are used just as the diagram indicates—background behind the flower, and a reflector in front, placed so that it softens the shadows to just the degree desired. Take care to make the shadows light enough—because your film, especially a color film, tends to see them darker than your eye sees them.

Study carefully the illustrations in this chapter; observe how the photographer chose his viewpoint, lighting, background, and the pose of each flower. Then start making your own collection of flowers pictures; you'll find it both entertaining and rich in its rewards.

Second International Club Print Competition

The results of the December Club Print Competition, second of the season, found the Oakland (Calif.) CC again taking the bi-monthly Class A trophy and establishing a firm first place lead with a total score of 168 points. Baltimore CC maintained its second place position, but shared honors with the Photo Guild of Detroit which moved up for a tie. In Class B. Bartlesville (Okla.) and Atascadero (Calif.) established identical high scores in their category with both clubs thus earning a trophy. In spite of this keen competition the Mission Pictorialists of San Francisco maintained their lead with an over-all high total score of 145 points

Judging took place in the club rooms of the Oklahoma CC, the Art Studio of Oklahoma City University, under the direction of Mrs. Harold E. Kuhlman. Two hundred thirty-two prints were received from 58 clubs. Judges were Grant Ginter, commercial photographer and member of the Board of Directors of the Oklahoma Photographers Association; Virgil Sisk, former member of the Oklahoma Club and well known photographer; R. Wade Vliet, portrait and illustrative photographer and a past president of the Oklahoma Photographers Association.

Individual winners were:

FIRST PLACE —"Patterns In Light" by
Delbert Pidgeon of the
Bartlesville CC.

SECOND PLACE—"Marble Corridor" by
Ed Jacobs of the Mission Sictorialists.

THIRD PLACE

(tie)

Stuart Shaw of the
Bell CC of Denver.

"On A Little Side
Street" by R. L. Curtis
of the Bell CC of

Denver.

The top ranking clubs are listed below. Next month a complete listing will appear. The fourth competition of the season will be held in April under the direction of the Owego CC, Owego, N. Y.

The Camera Eye is a beautiful optical glass. Highly polished and ground it represents man's ingenuity. These glass elements when placed in parallel serve the purpose of commanding and capturing the rays of light which "bounce off" the scene or subject at which it is pointed.

It can not think, this Camera Eye. It merely does the bidding of the person behind it. Its function is to relay the scene Time and again you have probably ended your darkroom stint with an avowed determination to send your negatives out to a commercial printer. Somewhere—you missed the boat! In your anxiety to produce a "super-duper" you've lost track of the basic rules of good darkroom processes. Because you are trying so hard you've pushed your mind into a tight knot which will not allow common-sense perspective to govern your actions. You can't see the center of interest because of the forest—if I may literalize upon an oft-quoted phrase.

Through the Camera Eye comes beauty. What you saw is undoubtedly on the film. All you have to do is bring it out on paper. Because you are a PSA member and also of its Pictorial Division, you are in a position to do something for yourself. You can make your pictures a thing of beauty and the envy of all your friends and camera club members. The Pictorial Division opens to you the services of one of the nation's leading pictorialists, J. Elwood

Judging the International Club Print. Competition for December are, left to right, R. Wade Vliet, Grant Ginter, and Virgil Sisk, all of Oklahoma City. (In the background members of the Oklahoma Camera Club tabulate scores.) Photo by Jim Kyle.

into the camera body to register upon sensitized material. And, from some of the photographs I have seen, it looks as though many of the people behind the camera lens cannot think, either.

Unless you're a Sunday Snapper you invariably photograph a scene or subject because something therein caught your fancy. Your purpose in making the exposure is to share that certain something with others. This is done by printing; during which time you attempt to achieve perfection . . . namely: to produce a print which is as eye-attracting and appealing as the original scene.

Armstrong, APSA. He, as director of the Personalized Print Analysis Service, is capable of leading your photographic pursuits from the Camera Eye into the hearts of all who view your work.

Undisturbed by any emotion which prompted you to make the exposure, Mr. Armstrong can coolly analyze your print and suggest various remedies or techniques which will serve to make a much better print. If you do not wish to send him an enlargement plus a contact print of the negative, your can write a letter in which you may bring out your problem. Perhaps, through correspondence, he might be able to help.

As I start in to collect all the miscellaneous items that are on hand for the column this month, and try to combine them into one harmonious whole, my mind keeps reverting to "Alice in Wonderland." Perhaps it is the influence of the mad March Hare, but I am inclined to think along the lines of the Mock Turtle's sad story:

'The time has come,' the Walrus said,
'To talk of many things:
Of shoes—and ships—and sealing wax—
Of cabbages—and kings . . .'

Camera Club Print Circuits

The one activity that never fails us is the Print Circuit. All clubs like to see and discuss the work of other groups, and at this time of the year there should be no difficulty in finding the three prints required from your club. So write Bill Hutchinson for an application blank, and then get the three prints in your own hands. Pack them up and be all ready to start them on their way to Newburgh, N. Y., as soon as the word comes. If you will do this there will be no delay in getting the circuit started and it will come to you when scheduled.

Circuit 51-D is now going the rounds and will call on the following clubs:

Kenoaha Camera Club, Kenoaha, Wisconsin South Omaha Camera Club, South Omaha, Nebr. Boulder City Camera Club, Boulder City, Nevada Kamera Kranks, Chico, California San Luis Obispo Camera Club, San Luis Obispo,

Calif.
Berkeley Camera Club, Berkeley, California
Fresno Camera Club, Fresno, California
Okmulgee Camera Club, Okmulgee, Oklaboma

The commentator for this circuit is John R. Hogan, Hon.PSA.

Recorded Lectures

As usual, the recorded programs are in great demand. So much so that Philip Maples has had to establish some new distribution centers. At the first of the year, he was personally looking after only the seven westernmost states, namely California, Oregon, Washington, Utah, Arizona, Idaho, and Nevada.

His assistant, William G. McClanahan, 922 Ryan St., Lake Charles, Louisiana, is handling all bookings in the following states:

Montana Nebraska Arka
Wyoming North Dakota Loui
Colorado South Dakota Miss
New Mexico Minnesota Alab
Texas Iowa Geor
Oklahoma Missouri Flori
Kansas Kentucky Tent
Illinois—south of Springfield.

Arkansas Louisiana Mississippi Alabama Georgia Florida Tennessee

He is supplied with a complete library of lectures and is handling all particulars of distribution in the above states.

The eastern and northeastern areas are now being taken care of by Walter F. Chappelle, Jr., 7 Winding Road, Rochester 18, N. Y. He has the following states:

Illinois-north of Springfield West Virginia Virginia Maryland Michigan New Hampshire Maine Indiana Delaware New York Pennsylvania Vermont Ohio New Jersey Rhode Island Connecticut South Carolina

If you live in one of the above states send your inquiries direct to Mr. Chappelle.

If your club has had all the recorded lectures listed, be of good cheer, for we can assure you there are some new ones in the making.

Portfolian Clubs

Somehow we neglected, last month, to report the list of officers that The Lincoln Portfolian Club elected for the 1952 season. They are: Vernon E. Pettet, President; Stanley D. Sohl, Vice President; Paren L. Miller, Sec'y-Treasurer.

Individual members of Portfolian clubs seem to be doing a lot these days besides criticizing other people's prints. They made a good showing at the PSA Exhibition in Detroit. Mr. Pettet had two prints there and Mr. Sohl had one. Challis Gore, chairman of the Berkeley (Calif.) Portfolian Club had two prints hung, and Frank Heller, Vice President of the Bartlesville Portfolian Club, had four.

At the Second International at Jonkoping, Sweden, Sten T. Anderson and Stanley D. Sohl each had a print hung and Frank J. Heller had four. Thirty-seven countries were represented in this show.

The latest Portfolian Club has been organized at Louisville, Kentucky, with Carl F. Nachod as secretary.

Camera Club Print Judging Service

This activity is now under the leadership of Fred Bauer, Jr., 383 Monroe Ave., Memphis, Tennessee.

Mr. Bauer is not only a photographer of prominence but a live-wire executive and is used to handling the problems that perplex

PSA JOURNAL, Vol. 18, Mar. 1952

camera clubs. I'll have more to tell you about him next month,

If your club is planning a grand competition for the last meeting in the spring, better get in touch with Mr. Bauer right away. It is very important that you have judges who are strangers to your group, and he can no doubt find some that are not too far away.

The service is free.

American Exhibits

By this time the chances should be good for booking one of the American Exhibits for a club meeting.

A new show to be known as the Southern California Exhibit is now ready and contains work by many of the fine pictorialists from that section. The seacoast and ocean scenes, as well as many lovely desert landscapes, have long been admired in salons throughout the country. This is an exhibit that every club should see.

Letters are coming in to Fred Fix, Jr. from many places, expressing appreciation of the exhibits that have been seen. The Central Florida CC writes that its members particularly enjoyed the exhibit of the Photographic Guild of Detroit, while the Savannah (Ga.) CC expresses delight with John Hogan's show.

The Standard Oil Company's exhibit was on the walls of the Cleveland Photographic Society for two weeks and was viewed by hundreds of visitors. All of the exhibits have been in continuous circulation, and shipments have recently gone to Canada and Hawaii.

If your club has never taken advantage of this fine program material, now is a good time to start. Just drop a card to Fred Fix, Jr. and arrange for a schedule of as many shows as you can use. If you have already had some of them get a list of the newer ones that you have not seen.

If you have a room to display them, arrangements can be made for holding the pictures for a week or more. As Mr. Fix assures us, the shows in American Exhibits have been assembled for PSA camera clubs and are to be used in whatever manner serves their purpose best.

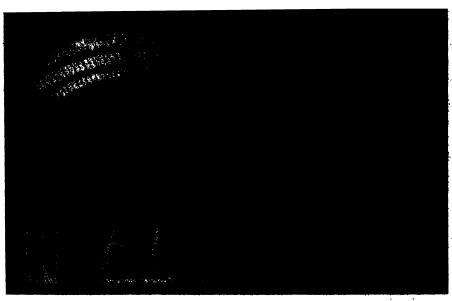

WALTER E. PARKER, Associate Editor

A Project for Friendship

A recent letter from a rather new PSA member in one of the foreign countries indicates how our overseas friends look to us in the United States for help and guidance in the photographic field as well as in other fields. This letter says, in part:

"I aim why eager to have photographs PSA JOURNAL, Vol. 18, Mar. 1952

Winners in the December International Club Print Competition. Left: "Marble Corridor" by Edward Jacobs, Mission Pictorialists, San Francisco, second. Right: "Patterns in Light" by Delbert Pidgeon, Bartlesville (Okla.) CC, first.

from time to time of American life by American photographers. On my part, I will send photographs from here for the benefit of such amateurs in the United States as may be interested in them. Through such an exchange I hope to widen my grasp and judgment of salon pictures. Although I am making good headway as a magazine photographer and my pictures are frequently featured in the press, I am not making any noticeable progress as 'a pictorialist."

Requests like this have come from all over the world, and through the International Exhibits we are trying to fill as many of them as possible. But we need more shows to send to our foreign friends—shows which will illustrate the American way of life.

If your camera club or your council or association can get together a show consisting of 25 to 50 prints, showing the American way of life, for exchange with a foreign group, the Director of this activity wants to know about it. Maybe

your club could combine with another club in another state and each could furnish half the number of prints needed to make up a show.

There is no service fee for this excursion into international friendships through the International Exhibits, and if your group exchanges prints with an overseas club, you will be the first to see their show when it is received in this country. It costs you nothing except postage to the next group on the list, and you will have the benefit of seeing the beautiful work done by our overseas friends and of providing much pleasure and instruction for them.

Write the Director today and make arrangements to participate in the International Exhibits.

HIGHLIGHTS PROM

Portrait Portfolios

PAUL J. WOLFE, APSA, Associate Editor

From Paul W. Hopewell, of Cincinnati, comes a portrait of a charming young lady (no other than the girl-friend of his son) to our Portrait Criticism Service. Paul Hopewell is haunted by many small dust marks seeking their way into his enlarger and influencing black spots and streaks on his cherished prints. He seeks the answer, but who among us that must use small negatives doesn't?

Read Paul's predicament then console him if you can: "I use a 2½x3½ negative"... but I'm afraid I was never intended to be like a Swiss watchmaker for I cannot do the fine retouching demanded by such small images. I use a magnifying glass, but I still can't get those fine lines so necessary. I have made dispositives, and tried other ways, but the more I try the more complicated life gets."

Paul Hopewell truly has a problem. Our task was one to assist and so we trapped Bernard M. Acosta, APSA, of Saranac

AN INVITATION

This is an invitation to every PSA member to participate in the PSA American Portfolios.

Enrollments are now being received in the following specialized groups:

PSA Pictorial Portfolios PSA Portrait Portfolios PSA Miniature Portfolios PSA Control Process Portfolios PSA Star Rahibitor Portfolios (For PSA Award of Merit Winners) PSA Nature Portfolios PSA Photo-Journalism Portfolios

For information concerning any of the foregoing activities and for enrollment blanks, write to the Director of the PSA American Portfolios, Eldridge R. Christhilf, Hon. PSA, APSA, Suite 406, 800 Davis Street, Evanston, Illinois. Lake, N. Y., an expert in the making, instruction and criticism of portraits, into giving Hopewell hope and help. First of all, however, Paul must know the high calibre of him who speaks.

Bernard Acosta was born in Costa Rica, Central America, traveled for Eastman Kodak Company as demonstrator and technician in South America, and then opened his own studio in Saranac Lake. Bernard teaches photography, gives lighting demonstrations, lectures and programs for his New York state conventions. Honors include an APSA and Master Photographer of the PAA. He began his exhibition work in salons in 1950 and to date has more than 160 acceptances. Photography is his avocation and vocation. So you see, Paul Hopewell, that words of wisdom from one of the country's top-notchers comes to you as Bernard speaks:

PORTRAIT

P. W. Hopewell

Most of the time it is easier to analyze a print than it is to produce a quality print of one's own. Yes, to tear apart the work of another photographer is an easy task and yet we have to do it for the benefit of those with less experience than we have.

We all make errors in trying to create a new photograph, no matter how many times we look into the ground glass. However, we do not discover our mistakes until the print is finished. Sometimes they are detected by ourselves, sometimes pointed out to us by another person. In our efforts to help our fellow photographers we ask them to take our comments in the same spirit with which they are given. We do not criticize but try to give a constructive analysis of the work presented to us to the best of our ability.

Before I speak about the print that I have in front of me, I would like to suggest to Mr. Hopewell and everyone else who submits prints for comment that they send us the complete data from the lighting of the subject through processing of the negative and print. This would facilitate our task tremendously.

Now referring to this photograph: This is a very pretty young girl and the photographer has captured an interesting and

pleasing expression. Yet I believe that a more suitable pose would have enhanced the portrait and brought out her personality much better. The slumpy pose gives a feeling of awkwardness and bunches the dress unpleasantly.

It seems that two spot lights were used as the main sources of illumination—one aimed to the hair and the other to the face. The latter light is too high and too close to the subject, forming objectionable highlights on the collar, left shoulder, and cuff of the dress and giving undue prominence to the creases. This too-high light also forms distracting hair shadows on the forehead and makes the eyes appear deep-set due to the shadow between the eyebrows and eyes. A fill-in light is needed in this portrait as the arms are too dark, the hair lacks detail, and the shadows on the right cheek and neck are too pronounced. Note too, the right hand of the girl is clenched giving a stumpy effect which is very objectionable in portraiture.

According to the direction of the light it seems that what should have been the shadow side of the face has turned out to be the highlight side. In this type of lighting the shadow of the nose should be half way between the nose and upper lip. Due to the high camera angle the nose appears too prominent. This lighting would be appropriate for a head and shoulders portrait, if the main light was placed lower and pointed to the center of the face giving equal density in both cheeks. This is called "butterfly lighting" and is flattering if you watch the nose shadow.

I would advise Mr. Hopewell and all photographers who are just starting out to begin with portraits of head and shoulders only. They are much easier to light and pose than are three quarters and full lengths. It is my belief that a knowledge of anatomy is necessary before dealing with subjects showing the figure. A good idea is to get a girl to model for you in a bathing suit and you will learn a good lesson in lines and body structure. For instance, I am sure that if Mr. Hopewell had posed this same girl in a bathing suit he would never have placed her in this position.

The sharp step-off in the background is distracting and would have been better if made wider (one-third of the entire area) and much softer. The original print is mottled and Mr. Hopewell asks for the cause. If I had complete data I could give a definite answer as it could be a defect in the negative or in the print. Mottling can be caused in the negative by using too warm developer, by using old developer, by using the wrong developer, by not agitating during development, or by using contaminated developer. Mottling in the paper can be produced by over-printing and underdeveloping using too warm or exhausted developer, etc. As for the question on dust specks on the negative, I always strike the film sharply against my left hand before loading as very fine grains of dust cling to the film.

Judging from Mr. Hopewell's letter, he is willing and eager to learn and improve and I would like to see him make some portraits using these suggestions.

COL. C. J. "JOE" PERRY, Associate Editor

A Message From Garcia

Fifty odd years ago the man on the street made frequent use of the expression "A Message to Garcia," a catch-phrase born in the bloody struggle for freedom and independence in which our Pan-American neighbors were then engaged with Spain.

A few short weeks ago the American General Secretary of PSA's Dominican-American Portfolio received a letter from another Garcia. This namesake of a historic warrior is the General Secretary on the Dominican side of that portfolio. Rather than thoughts of battle and blood-shed our 1952 message rings with thoughts of peace and international good will.

Juan Ulises Garcia, of Ciudad Trujillo, Dominican Republic, says in part: "Today is the day that all the free nations of the Western Hemisphere, and Spain, our motherland, have consecrated to praise and honor the outstanding deed of the discovery of these marvelous lands of the Americas; of these Americas that have been called 'The Hopes of the World.' No other day could be more appropriate than today for sending you all a sincere message of love, admiration and friendship, which we Dominicans hope to be lasting, loyal and constructive. Nothing is more enjoying and satisfying than to do something effective to promote and affirm some loyal links of friendship and respect among nations and men.

"In this corner of the Dominican-American Portfolio we feel that a real tribute of Pan-Americanism has been rendered, on sending you the comments on the prints in Spanish and in English, and with these comments we send our loyal devotion for this interesting friendship we are cultivating so successfully in the pursuit of our beloved avocation—photography."

In his message, Juan included excerpts from a letter written to him by the Public Affairs Officer of Trujillo City which also read in part:

"I have made a perusal of the contents of this portfolio and I am impressed by the quality of the photographs contained in this circuit—an eloquent testimony to the splendid work which the members of the Camera Club have been doing. I was particularly interested in the international phase of the activities of this group, which sponsors an interchange under the auspices of the Photographic Society of America. Although we normally consider the interchange of persons and books as outstanding activities which are foremost in the promotion of a better understanding between peoples of different countries, the activity

of the Camera Club in the field of international relations has conclusively demonstrated that the interchange of art has an equally important role to play in contributing to the mutual understanding of peoples. Certainly art is a medium which can be understood by all peoples, as is music."

In addition to these expressions of international good will is an editorial published in "El Caribe," a Dominican newspaper having a wide circulation throughout the Republic. The Editor of "El Caribe" says of the PSA Dominican-American Portfolio:

"Friendship among nations has its base on foundations stronger, more durable and permanent than the simple official interchanges. It is not in the Salons of Diplomacy, but in the simple mind of the man of the street, where comprehension and affection are forged. Comprehension and affection are the only and true way to attain a sincere fusion into a human whole, or the aspirations and purposes in capacity of lending a permanent peace and friendship among men.

"The way is hard and its sweep secular and safe. Every little conquest is a grain of sand poured into the edification of this idea. All activities must concur to this path, so miraculous, to make the understanding among nations more effective and prodigal, and in special all those artistic manifestations in which the soul of a nation is more genuinely represented. Under these conditions, the soul should be more identified with the sphere that it represents and expresses.

"This is the purpose beset in the Dominican-American Portfolios. Initiated not long ago, the interchange among groups of photographers of both countries, with a professional or amateur caliber, will certainly allow not only a wider critical appreciation, but also a better knowledge of the particularities and sensibility of each people."

That, was the message from Garcia—and the members of Pictorial Division's International Portfolios go on in their quiet and unassuming way, unheralded and without fanfare, cementing peaceful relations between peoples of the world and not alone building up their individual salon records but building up and solidifying international good will as well.

There is room in one of these portfolios for YOU- a postcard addressed to the Director will get you started.

American Portfolios

MISS EVELYN ROBBINS, Associate Editor

Chirps From the Robbins

Following in the column this month you will find a couple of articles that I hope you will enjoy as much as I did in going over them when they came to me.

In the first, "Tips from an Old Timer" you will find the contents of a personal letter which came to me from a good friend in PSA. Surprising enough, he has unknowingly given me the answer, through his reminiscences, to a question that has been bothering me for quite a long time.

Many, many times I have shown various portfolios to friends that I knew were very much interested in photography, but were not active in it. Do you know what their perpetual cry happens to be? They can't afford to become interested in photography! They say, "If only I could afford to go into photography.! The very first thing I would do, would be to join a portfolio. I think they are certainly wonderful!"

So, now, I'll pass along to you—and especially those who have mouned, "I just can't afford photography"—what I believe might be the answer that will allow us all to enjoy this wonderful hobby together.

Do you like this sort of thing? I'm trying to get him to do a whole series of PSA JOURNAL, Vol. 18, Mar. 1952

them for you. If he agrees, you will find them in future issues. I hope you enjoy them—they have been a source of a great deal of pleasure to me.

The second article, "Meet a New Member" has been taken from the notebook of Portfolio #47, in fact it is quoted nearly word for word. It was quite interesting to read of his impressions of the portfolio activity, and of the Society, so I am passing it on to you, in the hopes that you, too, will enjoy it.

I hope that we may hear more from Mr. Challis--and from many others like him, as well.

PSA International Portfolios

There are openings in the following PSA International Portfolios for Pictorial Division members who are interested in interchanging prints for comment and analysis with the leading photographers in foreign countries:

Anglo-American
Canadian-American
India-American
Australasian-American
Cuban-American
French-American
Swediah-American
South African-American
Brasilian-American
Belgian-American
Belgian-American
Chinese-American
Netherlands-American
Dominican-American
International Medical Portfolios
Costa Rican-American
Carribbean-American
Carribbean-American
International Control Process Portfolios
International Contro

For information, write to the Director of PSA International Portfolios, Col. Charles J. Perry, 7431 Ryan Road, El Paso, Texas.

Tips From an Old Timer

This afternoon I was just sitting and reminiscing for awhile, when the thought occurred to me that there are many poor souls who are today vitally interested in photography, but bemoan the lack of funds with which to purchase the equipment they think is necessary. They seem to feel that they are denied the pleasure of making prints because of this lack. Let me, for a bit, just put down my thoughts here in this column:

Wish you could see some of the stuff I started with! I had mighty little money to invest in any of the equipment that the present day operator has to purchase before he or she can do a thing—or so they think.

My early trays were made of pasteboard, shallow boxes and the lids, that I just soaked in hot paraffin. They worked fine and stood up well under long usage. Of course, from time to time, I would give them another dip in the paraffin.

My first printing frame consisted of two pieces of glass held together with a couple rubber bands—the negative and home made printing paper being placed in between the glasses. The paper was just ordinary common paper, sensitized with potassium ferricyanide and citrate of iron and ammonia. This was kept in two separate solutions in dark bottles. To use, I took equal parts of each and smeared the mess on a bit of paper; and hung it in a closet to dry. This was printed in the sun and washed in plain water. Nothing to it! Nevertheless, I sure had a lot of fun!

Later, I discovered another mixture I could concoct which produced a sepia print. Then, I was really branching out!

That was the start! From then on it was try everything, and, of course, to continue making equipment. I did finally graduate to a couple of trays that I borrowed from the kitchen (but only until I could save up enough cash to purchase a couple of standard trays of my own!).

For running water I used a wooden pail with a brass spigot screwed into the bottom. This sat on a shelf above the working table. All of this was in a homemade darkroom with a black curtain for a door. I sat on a soap box which I upended so I could have an open side in which to tuck printing paper, etc. It was really swell with all the conveniences! I even had a couple of small shelves filled with bottles collected from the dump. (These I filled with colored water for local color, chiefly to impress visitors!)

Finally, I felt that I just had to have an enlarger. With the aid of a hammer, saw, nails, and a pasite box for experimental purposes to get the distances by the trial and error method, I managed to make an enlarger to which I could attach my camera and make eight by ten enlargements. Believe it or not, I still have some of those enlargements.!

You know, it's a funny thing, but I still make things. For instance, I cannot seem to find any tongs that suit me. I like long ones; about two feet is a good size fourteen by seventeen without ever touching it with my hands (and I hate wet hands!). They are made of two strips of

thin wood, shaped to size and soaked in hot paraffin. They are then fastened together at one end with a bit of copper wire and a slice of that rubber stuff they put under carpets, or, one of those kneeling mats from the Five and Dime will also answer.

I might add that I now have an Omega enlarger and several other bits of equipment which I did not make. They all work pretty good, too!

Meet a New Member

By CHALLIS GORE, PORTFOLIO # 47

Thought you might be interested in meeting a new member of a portfolio, and hear about some of his thoughts on the activity. The following has been "lifted" from his entry in the notebook of Portfolio # 47:

"Four years ago I took up photography to keep from growing old. From that day forward, photography took me up. There is now so much that I want to get done in this absorbing field, I will have to live forever to accomplish it all. Accordingly, I am brushing up on geologic time, the Triassic, Jurassic and Cretaceous periods of the Mesozoic era, a mere 135 million years, so as to know how to talk and act about the 135 million years of the photographic era which we-all are now starting.

"I soon quit taking pictures of my wife and other glamour girls, got tired of having them ask. 'Do I look like that?!', and began specializing in old men with warts and wrinkles, old barns, and ghost towns, an example of which is my second entry in Portfolio 47, going in the collection section today. Among current projects I do enough pictures of Bill, 21/2, and Barbara, 1, our grandchildren, to send one a day to their daddy who is with the 40th Division in Japan. I did 'Bill's First Year,' a morocco bound volume of 70 prints 8x10, starting at 10 days old and going through to blowing out the first birthday candle, made two copies, one for the mother and one for the doting grandma, and that was my first photographic error. This year I had to do not only 'Barbara's First Year,' but also a volume of the two of them-a mere 350 prints or so to produce two volumes of each.

"Bill and Barbara have both modeled for winners in the Newspaper Snapshot contest, and Bill was the subject of one of my pictures in the Detroit Convention show.

"As another project, this year I am sending out the fourth in a series of California mission pictures as Christmas cards, 'salon' prints in miniature, 5x7, of which I turned out about 180 copies. Between times I am working on my portrait of California, consisting of the missions, the Mother Lode, the Pacific coast, the deserts (of which one example is in the portfolio), mountains, the things that make the state tick, such as its agriculture and its industries, tourist favorites, such as Chinatown, Fisherman's Wharf, and Yosemite, and places and subjects of historic interest.

"In addition, I compete in Berkeley CC and Contra Costa CC and enter a few of the shows, but not many. I also make color slides, and was in some 17 shows,

mid-1950-1951, but am marking time in this department for a while until I get caught up with my B&W work.

"At the Santa Barbara regional convention of PSA last summer, and on other occasions, I have been impressed with how much one can get out of the Society, and how eager its leaders are to have the members take full advantage of its facilities. Forthwith I spark-plugged the organization of a Portfolian Club in Berkeley CC, which started off last September with 22 members. We have Boris Dobro as sponsor, and are now planning a Camera Cramming Session for this spring, a week of day and night sessions with our sponsor.

"Instead of reading the funny papers, I get my laughs out of the tempest-in-a-teapot controversies which members of different photographic cults seem to have all the time. I don't care how you make 'em, so long as they are good pictures. I don't go in for trick methods myself, because I don't know any, and am too busy with the fundamentals to get involved in the frills. My test of any picture is, has it general interest, impact, sock value, has it melody to the eye, the same as music has to the ear, and is it technically well done. I do a lot of work that has no salon or competition possibilities, but I am trying to bring all my output up to salon and competitive standards, just because that means better pictures, and no matter what the purpose of a picture is, it should be well

PSA Recorded Lecture Program

The Recorded Lecture Program of the Pictorial Division offers the following programs for your club.

No. 1. An Analysis of Recognized Salon Prints by Ragnar Hedenvall, APSA

No. 2. Commentary on Recognized Salon Prints by Morris Gurrie No. 3. Outdoor Photography by D.

Ward Pease, FPSA
No. 4. Still Life by Ann Pilger

Dewey, APSA, Hon. PSA. No. 5. New Prints for Old by Barbara Green, APSA

SPECIAL Photography of the Nude by P. H. Oelman, FPSA

A deposit of \$25.00 should accompany an order. A service charge is made for each Lecture. The SPECIAL costs \$10.00 and should be ordered directly from Mr. Oelman. For clubs which are members of PSA but are not affiliated with the PD the charge is \$6.50. Clubs which are affiliated with the PD will be charged \$5.00. Clubs or groups not members of PSA will be quoted prices on request to the Director.

For Nos. 1 to 5 order from Philip B. Maples, Director, Recorded Lecture Program, 29 Spring Street, Brockport, New York.

For the SPECIAL please contact: P. H. Oelman, FPSA, 2505 Moorman Avenue, Cincinfati 6, Ohio. "I write for a living, take pictures, or make 'em, as the case may be, for fun. Not the glamorous kind of writing, but business and financial stuff, which I ghostwrite for corporation heads, and the like."

(How's this for an introduction to a brand-new portfolio member? He has an enthusiastic spark and a wealth of ideas from which we might well all take a lesson. I think, personally, that he has much to offer. Do you suppose we could get him to do a little article for this column? I'm going to try—so watch for it in a future issue of the Digest! And did you notice his excellent portrait on the cover of the January PSA JOURNAL?—Ye Ed)

Notes From the Notebooks

ELDRIDGE CHRISTHILF, HON.PSA, APSA, Director, PSA American Portfolios

As has been said many times, one of the very important items of the portfolio activity is the notebooks. In circles that are making the greatest advances, the notebooks are extremely active. In other groups that do not seem to be able to hit their stride, the notebooks are dull and uninteresting. Fortunately, the latter group are in the minority. We try to take time to read each new section of the notebooks when the portfolios arrive but that is not always possible. One of the duties of the Circle Secretary should be to cull through the notebooks on each circuit and to forward to Evelyn M. Robbins, Portfolio Editor of the JOURNAL, 2417 South 11th Street, Springfield, Illinois, any items that they feel would be of general interest.

This thought has been prompted by Circle #20 which has just arrived. We found much of interest in the notebook, and are quoting from the last entry of Cy Coleman, Detroit, Michigan, as we feel that it gives the portfolios a well deserved boost. Cy writes:

"There may be some camera workers who belittle or show no interest in the value of photographic portfolios but this writer cannot be one of them. Ever since he has enrolled in his first portfolio he has found it of great help, not only because it affords him a priceless association with fellow photographers but also for the valuable lessons learned from the freely and frankly made comments on the good and bad points of his photographic work. These comments and criticisms made in good faith are accepted in the same spirit. All of them have been applied as lessons for my subsequent work and I can say now that they have been somewhat responsible for the success of my prints in the recent salons.

"I do not wish to be a prolific exhibitor to salons but rather to make pictures to please most anyone and to have fun in doing it. I know that making prints for most salons is very demanding on one's time and patience and this is not conductive of enjoying what to me is the best hobby in the world.

"Many salon workers compile a sensational record of acceptances and stay in the limelight for a number of years then drop out. For these and others I recommend enrolling in a portfolio and once

PSA JOURNAL, Vol. 18, Mar. 1952

again enjoy the art of making a pictorial for the pleasure derived therefrom.

"Portfolios are a need for most amateur photographers for the lessons learned from participation and of getting a lift in spirits when some good work is recognized.

"When a portfolio enters my home I accept it in a spirit of comaraderie from 15 of my fellow members whose interest lies mainly in the enjoyment of making good and better pictures."

May I add, Cy is not a newcomer to the portfolios; but has been a member of Circle # 20 since its start, six years ago. He is also a member of other portfolio groups.

VIEWS AND REVIEWS

BY THE EDITOR

What Do You See?

Just as I started to work this morning, from a clump of trees toward where the sun was poking itself up over the houses, came a sudden shower of song from a redbird's throat. And in that moment I knew that even though the weather was cold and threatening, spring was not too far away.

Why can I be so sure when there are no other signs? But there are other signsalmost imperceptible, but they are there. In the protected places the tulips are beginning to push their tips through the ground, and the buds on the maple trees are swelling with the promise of the new leaves to come so soon. The signs are there if we but see them.

So it is with beauty everywhere. Beauty is there if we but see it. Do you look for beauty? If you do, you see it every day. Beauty in the tender look a mother gives her child-beauty in the riot of colors in the florist's window. Beauty in the clouds scudding across the sky before a strong March wind-beauty in the silvery pattern of the raindrops dancing along the shining

For we see only the things we look for. If we want beauty in our life, we must keep our eyes open for the beautiful things that are always around us. Look for beauty if you would see it.

What do you see in the pictures you come in contact with? Every picture that is taken has good qualities for some one, else it would never have been recorded. Of course, pictures don't always accomplish everything we want them to do. But there is still some good in every picture.

If our pictures tell a story, convey a mood, or awaken an emotion within us, they are successful for us. If they do the same for others, they are successful pictures for others, too. And the more successfully our pictures convey what we felt when we took the picture, the more successful they are.

Of course, we all see pictures differently. Our appreciation of any picture is limited by our own experiences and our own sensitiveness. It may be that the more our Elettures convey common experiences, the more successful they are with those who view them. But unless we grope toward a further understanding of the things which we do not fully understand now, we can never grow in soul and in capacity to make better pictures-to see more beauty around

What do you see when you look at the bare branches of the forsythia-dull, bare, ugly, winter-laden bushes. Or do you see the swelling of the buds, the tiny hint of the golden bells that are coming, the unmistakable signs of spring?

What do you see? You see the things you look for-in nature, in pictures, in people, in life. STELLA JENKS

PSA COLOR DIVISION

George F. Johnson, APSA Forestry Building, State College, Penna.

Star Rating for Color

A star-rating plan for color transparency photographers is being set up by the Color Division.

The plan now being considered on a tentative basis, calls for rating on two separate requirements: the first stipulates the number of different transparencies accepted and the second is based on the total number of acceptances.

The tentative requirements upon which the star ratings will be granted are as follows:

Rating	Different Transparencies	Total Acceptances
One Star	6	30
Two Star	16	80
Three Star	32	160
Four Star	, 64	320

The procedure is for the individual desiring a rating, to send a list of titles of slides accepted in approved exhibitions giving name and year of exhibition. Only pictorial exhibitions meeting the recognition requirements of the Color Division will be eligible. Recognized nature exhibitions may also be eligible for rating.

The plan is to issue an attractive certificate indicating the rating attained by each applicant meeting the specified requirements. It is expected that the plan will be in full operation by July 1, 1952, so that all recognized exhibitions during the 1951-1952 season can be included with those of past years.

Lloyd Robinson, Jr., 1616 West 109th Street, Los Angeles, California, will be in charge of the new Color Division Service. Write him for full information.

Color Contests Draw 120 Clubs

The National Club Slide Competition has now grown from two to three separate contests bi-monthly. Beginning with the December 1951 competitions, the clubs were regrouped into Class AA with 39 clubs, Class A with 42 clubs, and Class B with 39 clubs. The new classification was necessary because the substantial growth in the competitions during the past two years made the job of conducting a competition and writing appraisals for each slide too big for many clubs. Either the number of entries per club had to be reduced from six slides, or the clubs regrouped. A referendum of the clubs indicated clearly a desire to hold the full number of slides entered, but to divide the clubs into the three classes.

The popularity of this Color Division service is indicated not only by the increasing entries in these contests, but also by the fact that most clubs take full advantage of the service. In December, every club entered in Class AA participated in the competition and submitted their full quota of six slides each.

With the completion of the December contests which are the second of the five held during the year, the leading clubs in total scores were: Class AA, Chicago Color Camera Club and El Camino Real Color Pictorialists tied; Class A, Lens and Shutter club of San Bernardino; and Class B, Toronto Camera Club. A total of 109 clubs entered slides in the three December

The competitions are supervised by Merle S. Ewell, APSA, 1422 W. 48th Street, Los Angeles 62, Calif. Clubs not now entered in this popular Color Division project should contact Mr. Ewell about entries for the 1952-1953 season. There is no entry fee for clubs affiliated with the Color Division. Other PSA clubs pay \$4,00, and non-PSA clubs pay \$6.00.

Mounting Slides in Paper Masks

What to do about the "ears" on the paper masks used by many color slide photographers in mounting their transparencies, seems to be a question.

The recommended practice is not use the "ears" at all when mounting slides, but secure the transparency by use of tape on the mask. Warning against use of the "ears" without taping has been issued from time to time.

James H. Archibald, of Amsterdam, New York, comes forth in support of the paper masks with their "ears." He asserts:

"After much experimentation myself I finally came to feel that the mask type of slide mount was by far the simplest and most effective. Accordingly, I suspect that your warning will have a tendency to prejudice users against this type, and hasten to suggest that there are two simple expedients to prevent the film from slipping, and still retain the advantages of the mask. Here they are: The first way consists in punching a small indentation in each 'ear' with a pointed tool in such a manner that the tool pierces both the ear and the film. This will tend to create four tight points of contact. The second method consists of attaching two corners of the film to the mask with small pieces of Scotch tape, after placing the film inside the four ears. This is sure fire! Too, it ensures the proper location of the film in the mask."

Special Color Features

In another section of this issue of PSA JOURNAL, you have the Color Division's semi-annual special feature—a collection of outstanding articles on all phases of color photography, assembled under the able direction of Paul J. Wolf, APSA, of Hawthorne, New York.

Plans are already under way for the special feature to appear in the September 1952 issue of the JOURNAL. This project will be supervised by another member of the CD Editorial Committee, Harry G. Mitchell, 7455 North Greenview Avenue, Chicago, Illinois. Mr. Mitchell will appreciate receiving from PSA JOURNAL readers any suggestions for making the September issue as outstanding as CD special features of the past.--G.F.J.

Coming Color Exhibitions

Toronto, March 24-26, deadline Mar. 8. Four slides, \$1. Forms: W. J. Blackhall, 2 Gould St., Toronto, Ont., Canada Columbus, deadline March 31. (Exhibition in April). Two sections: pictorial slides and nature slides. Forms: John Shelley, Box 187, Thornwill. ville, Ohio

Ville, Omio

El Camino, Apr. 29-May 20, deadline Apr. 12.

Four slides, \$1. (Incl. 234) Forms: George E.

French, 3877 Olmstead, Los Angeles \$, Calif.

Southgate (England), May 17-31, deadline April

23. Four slides (up to 234), \$1. Forms: N. F.

Kember, 13 Ravenscraig Rd., New Southgate,

N. 11 London England N. 11, London, England

PSA (New York), August 13-21, deadline July 10. Four slides or prints. Entry fee \$1. Forms: Paul Wolf, 354 Ft. Washington, Hawthorne,

PSA STEREO DIVISION

DON BENNETT .

28 Leonard St., Stamford, Conn.

We lead off the column this month with a welcome statement from the Chairman of our new Stereo Division, Dr. Frank E. Rice, APSA, of Chicago. Dr. Rice has the right idea about the things a Division can do to serve its members. From here on it is Dr. Rice talking:

The PSA has been for a long time taking notice of the growing interest in stereo photography. Beyond mere record and travelogue shooting, many owners of stereo cameras are thinking of their pictures in terms of artistic appeal. For instance, the Chicago Lighthouse Exhibition in 1951, its Third Annual, attracted entries from 361 photographers.

Organizations of stereo photographers have been increasing rapidly. There are two old national organizations: The Stereo Guild and the Stereo Society of America. In recent years, local groups have been formed in Milwaukee, Hollywood, Cincinnati, Dayton and Chicago. In many other cities stereo programs have been made a part of regular camera club activities. Besides the Chicago Lighthouse Annual Exhibition already referred to, the Milwaukee group had their Second Annual in December 1951.

In recognition of this growing interest in stereo, PSA has devoted considerable space in its official journal to the subject. In 1951 Owen K. Taylor had a series of articles; Don Bennett is writing a column containing many helpful hints to those inclined to improve their work; a number of semi-technical articles have appeared, as, for instance, the series by J. A. Norling; to name but a few.

Early in 1951 PSA Color Division inaugurated a stereo slide circuit which was thought might prove to be a "once around" deal; but the circuit is still going strong, and is now on its third round of 14 enthusiastic photographers. (Incidentally, many of the members of the circuit are experienced photographers; 3 are APSA's.)

Later in 1951, PSA Color Division authorized an individual stereo slide competition. George Blaha was delegated to receive the entries and handle the judging. November 20, 1951 was the first deadline. Entries came in from many members of PSA. Two other competitions are scheduled-February 20 and May 20. Medals and ribbons are awarded the makers of the best slides. Criticisms of all slides are provided.

Throughout this period, stereo was assigned to the Color Division. To George Johnson, APSA, Chairman of that Division, goes great credit for sparking these various activities. All the services of the Color Division were made available to stereo workers, for instance, the library service, which was handled directly by Harry Haimes.

Now, the latest chapter in the story can be recorded. The PSA Board of Directors. meeting in New York on November 10, 1951, decided that the stereo "infant" had grown to the point that a separate Division would be justified. And it was voted unanimously that the Color Division be commended for the good start the "baby" had made under its care.

Later, the writer was asked to serve as the first Chairman of the Division. This he agreed to do (with some misgivings). However, he has been receiving so many reassuring promises of support and help, that it looks like the "child" is surely on his way to being a real lusty individual in short order.

Now there is lots of work to do. And your Chairman is busy (like everybody else), and does not like to work very well anyway! So we expect a lot of help.

All the services which were started under the Color Division will be continued. In addition, a stereo show is planned for the PSA Convention in New York next August. Norman Rothschild is in charge of that activity. He can use some help.

Don Bennett will continue to conduct the column on stereo in PSA JOURNAL. Give him or me reports on what is happening in your neighborhood stereo-wise. Write up for him anything you run across that you think will be interesting or helpful to other stereo workers. If we receive more material than can be placed in the JOURNAL, we will probably start a special bulletin to members of the Stereo Division.

Let me have your suggestions for other activities that could well be undertaken by PSA of interest to stereo workers.

And now is a good time for you to consider sending in your dollar for membership in the Stereo Division. All these things cost money, you know. President Harkness made a suggestion which I think is a very good one: The first 100 to sign up will be designated as Founder Members and their names will be published in PSA JOURNAL.

Again—please—your suggestions and your help. Dr. Frank E. Rice, APSA

Thank you, Mr. Chairman. Well, gang, you can see there are big things ahead for the Division, but let's repeat that under our PSA set-up, you're not in it unless you belong. You can read the stereo news on your general membership, but to take part in Division activities, you pony up the extra buck for Division dues.

Dr. Rice passes on several items of Chicago stereo news that may interest you three readers (one up since last month). We told you about Jackson Park but here is the name of the Chairman. He is Earl E. Krause, 5706 S. Harper Ave. They meet first Wednesday at 6200 S. Kenwood Ave.

Another Chicago group is the Stereo Camera Club of Chicago, meeting second Wednesday at Chicago Art Institute Cafeteria. President is Julius Wolf, 8238 Eberhart Ave.

You other stereo groups who want to attract members from among the PSAers in your vicinity, let us know.

Dr. Rice mentions a controversy about the right way to dot stereo slides. What is wrong with the standard method that came into being perhaps 75 years ago and is still used by everyone but Johnny Newcomer?

Ever wonder how the spot came to be called "thumb mark"? Back in the days when the high spot of a shindig was magic lantern entertainment, a lantern operator was supposed to put on a flawless show. The professionals held the slide by a far corner between thumb and forefinger, letting the near corner rest on the edge of the hand. If the picture was right side up, and correct as to right and left, a quick flip, pivoting at the thumb grip, inverted the slide into the carrier properly aligned for projection. Soon the pros began to dot the slide with a thumb mark, a circle of white or red paper stuck to the glass where the thumb would naturally fall. Naturally, in the projector this spot lies at the top

So why not spot stereo slides like any other slides? If it is easier to affix the PSA ROURNAL, Vol. 18, Mar. 1952

spot to the center label panel, you can still put it on the lower left, although why waste label space when the outer left corner has ample room for the spot.

One good reason for this position is that after the slide is in the carrier, you can still check orientation at a glance.

Let's stir up a tempest. Use your own teapot. Dr. Rice thinks there should be a name for stereo photographers to set them apart from others. Personally the conductor of this merry-go-round can't find anything wrong with stereo photographer. It doesn't require translation. But maybe you'd rather have stereotician, from mortician; or stereotrician, from electricity or obstetrics; or stereographer, from who knows where. Then we might come into four-eyes, adding up ours and the cameras, but if we bring projector and viewer in too, we'd be eight eyes. How many eyes does a fly have? 500? 1,000? He's tough competition. But who wants to be a fly?

You know, you can carry this name thing too far. When the New York Section of the Technical Division was created, somebody (who did it has never admitted the fact) christened the monthly news sheet "Photonologist." Wow! Supposed to be the result of marrying photographer and technologist. The legitimacy of the offspring is in doubt since neither parent has been seen since the delivery.

We just offer it as an example of how far coining names can take you. Photography's early history was full of such efforts. One we liked best was "getthemoneygraph." Punctuate it yourself. Only one or two have persisted, like Animatograph, meaning live pictures, and Epidiascope, meaning we know not what, but you can still buy one.

So until the Division Council sits on our necks and makes us yell "Stereophototrician," we'll continue to divide youse guys up into addicts and fans, and while we respect you addicts, we'll still write for the fans.

Note: Send one buck, your name and address and a statement "Enroll me in the Stereo Division" to PSA Headquarters, 2005 Walnut St., Philadelphia 3, Pa.

PSA NATURE DIVISION

HARRY R. REICH, APSA

286 Schenck St., No. Tonawanda, New York

Calendar of Nature Exhibitions.

Fourteenth International Exhibition of Nature Photography of Buffalo at the Buffalo Museum of Science. Conducted by the Science Museum Photographic Club, Buffalo, New York.

May 31, 1952.

For information and entry forms address communications to Harry R. Reich, 286 Schenck Street, N. Tonawanda, New York.

New Nature Exhibition in Formative Stage

Negotiations for PSA recognition of a new nature exhibition are presently in progress. This exhibition would be conducted by the New York State Museum at Albany, New York, under the direction of W. J. Schoonmaker, Museum Exhibits Planner. Mr. Schoonmaker is not exactly new to nature exhibitions as he has on several occasions in the past served on juries of the Buffalo International Exhibits of Nature Photography.

Just to whet the appetites of nature exhibitors I might mention that this new show is more than a remote possibility, as Mr. Schoonmaker along with his letter requesting the blessings of PSA submitted a tentative entry form with dates, rules of conduct and even the names of the jury. There are a few minor details that will have to be worked out, however, in order to have the proposed exhibition conform to PSA Exhibition Practices and Nature

Division standards. There may be a pleasant surprise in store in April or May.

I Told You So

In a recent issue of the JOURNAL the writer in this column implored Nature Division members not to sell your nature pictures short and advised you to let them compete with the best the pictorialist had to offer. Last night, as a member of the Color Committee of the Science Museum Photographic Club, I had an opportunity to give comments on the Traveling Color Slide Circuit of the PSA Color Division. This show travels among member clubs and each club is to criticize all of the slides and vote for first, second, and third places. At our meeting it happened that there were several of the members of the Nature Division Executive Committee present. The number of slides that were strictly nature material was so marked that it caused comment. After the showing and the balloting these members of the Executive Committee went over the slides and found that by actual count half of them were of material that would be acceptible in any nature show, and what is more they held their own with the pictorial slides.

If you would like to prove this point further, I suggest that, if you live in a section of the country where the "Tops In Photography" show is scheduled to appear this year, you make it a point to see it. It includes 50 prints and 60 slides made by some of the outstanding nature workers of the United States and Canada. These are, of course, strictly nature subjects. After you have seen the show I would like to hear your reactions.

Mixed Emotions

Recently, your columnist happened to sit in with a group of camera bugs who were fanning the breeze, so to speak, for lack of something better to do. The patter got around to photographic exhibitions and the treatment some of their best efforts had received in this or that exhibition. As the group was predominately a nature group, nature exhibitions came in for the brunt of the abuse. Maybe I should say the judges rather than the exhibitions, because it developed that in the final analysis the jury was responsible for the caliber of the show.

The writer sensing an item for this column in the making decided to keep his mouth shut and listen. Exhibition catalogues began to appear and this jury and that jury came in for its share of criticism. This one was composed of an entomologist, a botanist, and an ornithologist, and nary a photographer in the lot. That show had a newspaper photographer, a garden club enthusiast, and a zoo photographer, and nary a student of the natural sciences, and so it went.

About this time the writer had the temerity to inquire if they could agree on the composition of the perfect nature jury, and to his amazement, with one accord, they said they could. Well, this was just too good. Here was the solution to all of the nature exhibitions' future problems in the selection of juries. I got out my little notebook and said let's have it, and here it is. If you are conducting a nature exhibition and want record entries you have only to see that your jury consists of a recognized authority on natural history, an expert photographer producing nature prints, and an expert photographer producing nature color slides.

You know something? I think they may have something there.

Where to Begin

Webster defines "Natural History" as the scientific description of the earth and its various productions, especially the animal and vegetable kingdom. I have occasionally been asked by those among my friends who contemplate adopting nature photography. "What is nature photography, and how and where does one begin to become a photographer of nature?" I suppose I could reply that nature photography is the photography of nature. While being true it doesn't mean very much. To the beginner who has a workable knowledge of basic photography, but who hasn't studied any phase of natural history and is not familiar with any of the varied manifestations of simple natural phenomena which occur around us all the time and are readily perceptible to anyone whose curiosity runs in that direction, to him I would say that the best way to start would be to make a few field trips in the company of one or more of the great nature writers of the past or present through the medium of their books, which are, I believe, easily obtainable in public libraries.

When one has visited the "Grassroot Jungles" or has journeyed to the "Near Horisons" in the genial company of Edwin Way Teale, the problem of where to begin one's career as a nature photographer will

be definitely and pleasurably solved. He will introduce you to strange and interesting creatures of the insect world whose habits and antics are as bizarre and fascinating as they are unbelievable. If you have not been fond of observing insects in the past. I assure you that you will have an entirely different conception and attitude toward the world of the insects after spending a few pleasant evenings in acquainting yourself with the denizens of Mr. Teale's books. These strange and incredible creatures are not habitants of some far away exotic jungle; most of them are as nearby as your own doorstep. If your interest is in one of the other of the many fields of natural history, the same formula would apply, read a good book on the subject and you will not be at a loss as to where to begin. It really doesn't matter very much in what direction you choose to start, because eventually, if you will follow through, you will in the normal course of events be led by your camera through the many byways of nature. Regardless of where one begins, it seems to start an endless chain of possibilities which beckons one on from one field to another. For instance, you are working with living larva. To keep them alive they must be given the food that they normally live on. To select their food plant you learn something about botany. The study of plant life can be very interesting, and presently the thought occurs that here also is interesting material for the camera. The plant world is closely associated with bird life, so this becomes another possibility, and so it goes, on and on in an ever expanding circle.

Finding material to work with is not difficult when one learns to see not only what is being sought, but to see and be aware of everything that is there. It is amazing to realize how much we miss by not consciously training our eyes and ears to see and hear that which is not immediately obvious. Of course, one can never learn to see all that there is, but with a little concentration in that direction, we need not go through life blind to the wonders that we can enjoy and in some

small measure capture on our film. This, I believe, is a very important accomplishment to the nature photographer.

Another valuable tool, probably the most valuable, is "patience." It sometimes happens that the first attempt is crowned with success, but unfortunately, that is not always the case. It may mean long silent waiting, or long periods of planning and working for that one moment when conditions are perfect for your purpose. It can also mean doing the same subject over and over again for years to eliminate the very last flaw, as is the case when working in color on seasonal animal life whose season is very short. By the time the film is processed, should you wish to correct any short-comings, it means waiting a year until specimens are again available. To the meticulous worker, patience can also mean long hours spent in study and experimentation so that his presentation may be scientifically authentic.

"What is Nature Photography?" In a broad sense it is the photographic description of the earth and its various productions, but in a narrower and more specific sense, it means something different and personal to every worker in this field, because as it is in all of the arts, one cannot do something that he loves without leaving something of himself in his accomplishment.

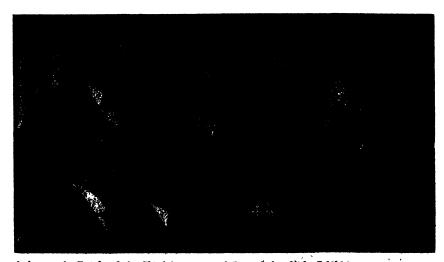

Louis Quitt

Rose Slide Exhibition

Forty nine photographers, a majority of whom were PSA members, entered 245 slides in the 3rd International Rose Color Slide Exhibition, sponsored by the Reading Rose Society and the Berks CC. Four awards went to Norman E. Weber, of Bowmansville, Pa.

Other winners included Mrs. Ellery E. Bennett, St. Joseph, Mo.; O. A. Kidwell, Pasadena, Calif.; John H. Kline, Reading, Pa.; and G. J. Sanborn, Pattapan, Mass.

A group of 50 slides from the Exhibition are available without charge for showing by any PSA Club. Send requests to Blair M. Sleppy, PSA, Exhibit Chairman, Berks CC, 550 North 11th St., Reading, Pa.

Judges and officials of the Third International Rose Color Slide Exhibition viewing entries. From left are: Seated, Fred Quellmais, Jr., Hon. PSA; W. H. Bozman, chairman, Philadelphia Rose Society; Dr. R. C. Allen, president, American Rose Society, Harrisburg, Pa. Standing, G. A. Hampfler, FPSA, Kennett Square, Pa.; Fred S. Glass, president, Reading Rose Society; George F. Johnson, APSA, State College, Pa.; and Blair M. Steppy, PSA, exhibition chairman.

Either way, you can show your color slides at their best with Kodak Projection Equipment

LIGHTS ON

Here's a new kind of color slide enjoyment. The Kodaslide Table Viewer, Model A, combines screen and projector in one compact unit, and is so attractively designed that many make it a permanent fixture in their living rooms.

With a Kodaslide Table Viewer you will always be ready to show your slides to a visitor . . . or to enjoy them yourself . . . without rearranging furniture or turning off the lights.

The Model A Kodaslide Table Viewer has a big Day-View Screen to give you brilliantly clear pictures, enlarged about five times. A plunger-type slide changer accepts either 75 cardboard or 30 glass slides—or a combination of the two. Has rugged die-cast aluminum body finished in buff and brown. Price, \$97.50. Carrying case, \$27.50.

Similar in operating principle but made of dark mahogany plastic and incorporating a simple, side-to-side single slide feed, the Kodaslide Table Viewer, 4X, provides maximum performance at an attractive price. 4X has finger-tip focusing; the Day-View Screen provides easy slide viewing in a brightly lighted room with four-time enlargement. Price, \$49.50. Carrying case, \$15.50.

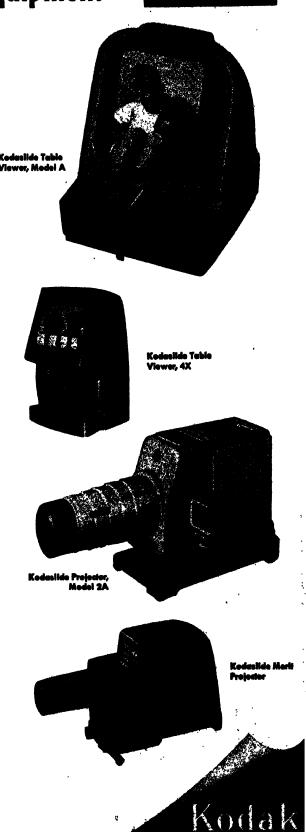

Whether you are just stepping out in color—or are stepping up . . . you will want a slide projector that's made for years of enjoyment . . . one that provides the projection quality your most critical audiences will applaud. That, of course, is a Kodaslide Projector, Model 2A, with 5-inch Kodak Projection Elemon Lens f/3.5. For projection in larger rooms and at greater distances from the screen, you can select a 7½-inch Kodak Projection Ektanon Lens f/4. Definition is needle-sharp, color is crystal-clear. Screen images assume a lifelike reality. Push-pull slide changer. Heat-absorbing glass and efficient convection cooling protect your slides. Has built-in elevation control, rugged die-cast aluminum body. Price, with 5-inch lens, \$52.80; with 7½-inch lens, \$63.45. Carrying case, \$15.00.

Economically priced, but worthy of the plaudits of color slide enthusiasts, is the Kodaslide Merit Projector. It has a 150-watt lamp and a 5-inch fully corrected Lumenized f/3.5 Kodak Projection Ektanon Lens to provide maximum screen brilliance and warmth. A special feature is the top-slot feed which permits easy operation and eliminates side-to-side jarring or unintentional repeats. Built-in elevating mechanism. Price, \$26.10. Carrying case, \$9.50.

Prives in this Kedah Balletin are list, including Federal Tax where applicable, and are subject to change without notice.

EASTMAN KODAK COMPANY, Rochester 4, N. Y.

Experts' Choices For Fine Prints

No. 3 of an informative series...how leading exhibitors choose papers to fit their salon aims

EUCALYPTUS" is one of Frank Heller's newer salon prints. The rich darks and delicate light tones of the subject demanded a paper of fullest tone scale, plus the ability to separate closely spaced tones at both ends of the scale. Mr. Heller wisely chose Kodak Opal Paper G, the image quality and tonal range of which have made it the most popular of all salon media.

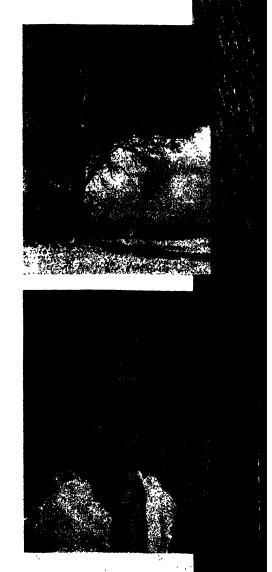

For the beginner, Frank Heller has a word of advice. "I strongly advocate that an individual

standardize his photographic procedure by using one type of film and one type of paper until he thoroughly familiarizes himself with their inherent qualities, and then and only then explore the other paper surfaces that are available." This, he feels, is the best way to build a sound foundation of experience, and an understanding of the potential quality inherent in good photographic paper. Kodak would also add that it is a thrifty, paper-saving policy.

The beginner needs to gain experience rapidly—and the top-quality, moderate-speed papers such as Kodak Opal may seem inconveniently slow. For more rapid printing plus excellent quality, Kodak Platino Paper (about two and one-half times as fast as Opal) and Kodak Medalist Paper (about six times as fast as Opal) are good choices. Both of these are rich, warm-black papers, with a choice of surfaces and a range of printing grades to accommodate both soft and contrasty negatives. For exhibition and gift prints, lustrous Platino G or P, or Medalist G or J, is appropriate. This small reproduction of Gottlieb Hamp-fler's "Pennsylvania Snowscape," which appeared full-page earlier in this series, is from a print on glossy Platino F.

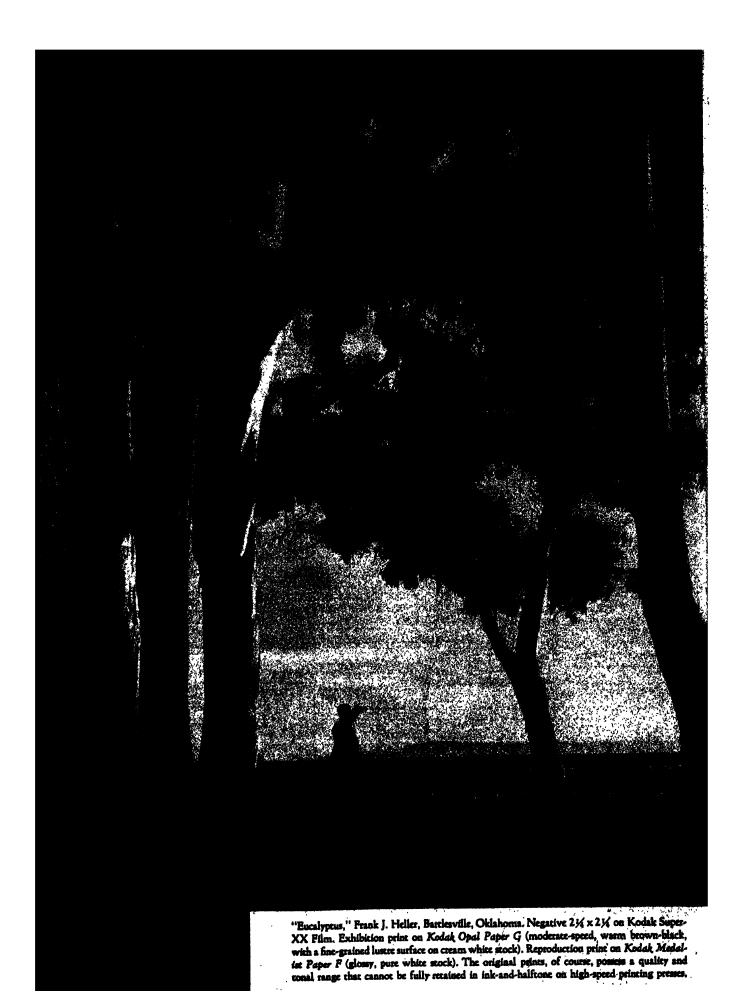

What is the purpose of the print—exhibition, gift, publication, small display, large display? Whatever the purpose, there's a Kodak paper to fit it. The small reproduction of Josef Schneider's "Susan" is from a print on Kodak Illustrators' Special—the paper he would naturally choose for top-quality halftone reproduction. Medalist would be an alternate choice. For exhibition, Opal, Platino, or Medalist, in a salon surface. For a luxurious portrait presentation, Opal or Kodak Opalure Print Film. And, of course, each of these fine Kodak enlarging papers is matched by a contact-print paper of similar character.

Know year Kodah papers, for knowledge spells success. For fine exhibition enlargements, gift prints, home decoration—choose from warm-black Medalist and Platine, brown-black Opal, Estalure G, and Illustrators' Special, and neutral-black Kedahremide. For special applications, Kedah Mural R, Resiste Rapid N, Opalure Print Film, Translite Paper. For contact prints, Kedah Ase, Velex, Resiste N, and others. Consult the Kodak Data Book on Photographic Papers, and your Kodak dealer.

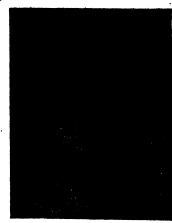

EASTMAN KODAK COMPANY, ROCHESTER 4, N. Y.

The World's Most Versatile Line of Speedlights

ASCOR SPEEDLIGHTS

"Speedlights For Every Job"

MIDGET 80

The Midget 80 is an outstanding light weight portable speedlight designed specifically for applications where small weight and size is of extreme importance.

- Operates on either AC or self-contained battery. Weight 4 lbs. 12 oz. without battery; 61/2 lbs. with batter
- Built-in charger.
- 4. Condenser reforming circuit. Reforms the electrolytic condensers at same time battery is charging.

 5. Only 12 oz. added to weight of camera. Light unit is
- small and compact.
- 6. Wide angle even coverage reflector.

Send for Complete Literature Sold Only Thru J. G. Saltzman, Inc. 480 Lexington Ave., New York, N. Y. and other Authorized Dealers

AMERICAN SPEEDLIGHT CORP

OFFICIAL NOTICE

On page 135 of the February Journal, amendments to the PSA By-Laws, as passed by the Board at its October 11th meeting, were published. Subsequently, the Board decided to establish Canada as a separate region. This action nullified the previous amendment to Article IX, Section 2e.

The amendment, which is hereby published as required by the PSA By-Laws, now reads:

"Four (4) members of the Society, one elected from each of the following four (4) regions, the first to represent the geographical Eastern section of the United States comprising the official Eastern Time Zone, the second to represent the geographical Mid-western section of the United States, comprising the official Central Time Zone, the third to represent the Western section of the United States, comprising the combined official Mountain and Pacific Times Zones. and the fourth to represent all Provinces of Canada."

MRS. C. B. PHELPS, JR., HON. PSA, Sec.

Barbara Green To Tour Mid-West

Barbara Green, FPSA, FRPS, of Brooklyn, N. Y., is now planning to add several more lecture appearances to a spring trip she will make to St. Louis, where she will serve on the jury of the 10th St. Louis International. She is again available to clubs under the National Lecture Program. There are a few open dates between mid-April and mid-May and clubs that are interested may yet be able to arrange for her to appear. Letters or telegrams should be addressed to Mrs. Green herself, as National Lecture Chairman, 30 Willow Street, Brooklyn 2, N. Y.

The April-May 1952 lecture tour is an outgrowth of her highly successful tours made in the spring and fall of 1951. In the coming series, "New Prints for Old" will again be given. However, some clubs who heard this lecture last year have aiready scheduled another talk of Barbara Green's. This is "Don't Watch the Birdie!"-an instructive and amusing discussion of child photography, illustrated with fifty

of her superb prints.

PSA TRADING POST

Open to individual members, free of charge. Limit 25 words each. Copy closes the tenth of the second preceding month before publication.

For Sale-Rolleiflex, automatic, like new. Tessar f/3.5, case, filter, lens hood, red screen, Proxar #2 set lenses, gadget bag. Make offer. Zeiss Deltrintem binoculars, 8 x 30, case. Make offer. Louis F. Bucher, 592 Broadway, Newark 4, N. J.

For Sale-5 x 7 Graflex, no lens, Graphic back \$30. Spencer 31/4 x 4 slide projector short 4" lens for small slides, 500 watt. \$25. No scratches. DeWitt Bishop, 2548-8th Ave., Sacramento 17, Calif.

For Sale-Schneider Angulon 1/6.8 in Prontor Synchro \$30; Ilex Paragon 51/2" f/4.5 in #3 Acme Synchro \$38; Ross Teleros 9" 1/5.5 covers 21/4 x 31/4-\$30. M. L. Friedman, 5016 3rd St., N.W., Wash. 11, D. C.

For Sale-Kodak Monitor 620, coated f/4.5 flash supermatic shutter, case. \$46. Harold Sorbye, 3538 Gregory St., Madison 5, Wis.

Wanted-Colortran unit, Groverlites excellent 8 x 10 W. A. lens in shutter, densitometer, 8 x 10 or larger contact printer with Argon bulbs. Have Movie Mite Sound Projector or ? H. Ernest Schubert, 254 S. Terrace, Columbus 4, Ohio.

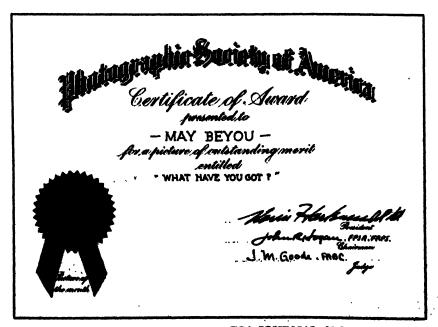

PICTURE OF THE MO

Next month the scores and some of the winning pictures will be published, but don't wait for this because all entrants in the January and February contests have received full information direct, and will receive full information about the March contest soon after the end of the month. Read the Rules in the January and February Journal and send your prints to:

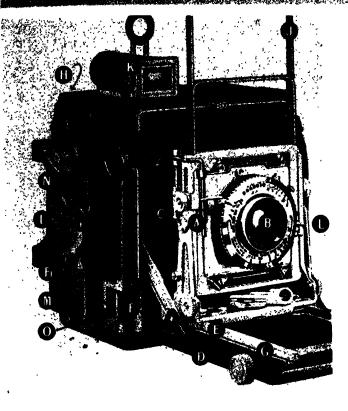

Picture of the Month,

The Photographic Society of America. 2005 Walnut Street,

Philadelphia 3, Pa.

- CONTORTIONIST FRONT. For corrected perspective whenever you want it. Simple controls raise or lower the lens, shift it sideways, or tilt.
- INTERCHANGEABLE LENSES. A flip of the slide-locks and your lens is ready to be replaced with a portrait, wide-angle, telephoto or other accessory lenses.
- DOUBLE EXTENSION BELLOWS. For extreme close-ups. Permits full-size copy with standard lens. Invaluable too, when using special lenses.
- DROP SED. Heips correct perspective in conjunction with tilting lens board... and for use with wide-angle lenses. Bed remains linked to focusing knobs.
- FOLDING INFINITY STOPS. Bring the front into exact calibration with Vernier focusing scale and squared with film plane. Stops fold back, allowing front to move farther forward. Additional sets of stops can be installed for use with different lenses.
- BODY SHUTTER RELEASE. Set right in the camera body for extra stability at the instant of exposure. (F.1.) Speed Graphic has selector control, too, for instant

Your Pacemaker Graphic takes every challenge your skill can give it!

Speed Graphic or Crown Graphic ... whichever famous Pacemaker Graphic you choose ... you'll find that there's no challenge it won't respond to, no problem it can't resolve with first class results! This amazing versatility, plus a Pacemaker's ease and speed of operation ... has made it America's most popular all-purpose camera with press photographers and amateurs alike. Speed Graphic (illustrated) has focal plane shutter with governed speeds to 1/1000th. Crown Graphic is identical, but without focal plane shutter ... and costs less. Here are a few of the prize-winning features ... but, of course, you must actually handle a Pacemaker Graphic to get a full appreciation of what a great camera it really is!

New Low Prices from \$174.15

choice of shutters operable by the same release. MULTIPLE FOCUSING CHOICE.

Use one, or use them together, they guarantee razor-sharp focus! The accurate Vernier type focusing scale on camera bed . . . Ground glass focus through the lens . . . and the coupled Kalart rangefinder (optional).

- MULTIPLE VIEWING CHOICE. Folding open frame viewfinder with parallax correction...
 Tubular optical viewfinder with parallax correction and the ground glass screen.
- BUILT-IN FLASH SYNCHRONIZATION.
- © GRAFLOK BACK. Designed to take such valuable accessories as 120 Roll Holder, Grafiarger and Grafmatic Film Holder. (see next page)
- © DIRECT READING FOCAL PLANE SHUTTER SPEEDS. No tables to consult. No calculations.
- GOVERNOR SELECTOR. Doubles or halves exposure with flick of finger. Insures optimum accuracy of shutter.

BOOK REVIEWS

THERE'S MONEY IN PICTURES, by Leo Solomon, Funk & Wagnalls Co., 153 E. 24th St., New York 10, N. Y., 198 pages, $5\frac{1}{2} \times 8\frac{1}{2}$, illustrated, cloth, \$3.00.

PICTURE EDITING, by Stanley E. Kalish and Clifton C. Edom, Rinehart and Co., New York, 207 pages, 71/2 x 101/4, illustrated, cloth, \$4.50 College Edition. \$6.00 Trade Edition. 1951.

These two books have reached the market at about the same time, and it is interesting to note that the author of the first is an ex-news service picture man (Chief of Wide World Photo Service) now serving as Chief of Press Photo Unit of the Dept. of State, and that one of the authors of the second, i.e. Kalish, was also

Tutorial instruction by John W. Doscher in salon photography, pictorial control, color, and special processes.

successful news picture man (Picture Editor, The Milwaukee Journal) also now with the Dept. of State in the Photo Branch of the International Press Division.

Leo Solomon's interesting book is aimed at the amateur photographer trying to make his hobby pay off in photo-journalism. Leo preaches no technique, healthily assumes that the reader is a photographer who knows which end of a camera to point. His advice, based on over thirty years in the picture business is straight from the shoulder suggestion on marketing.

The tips on saleability of pictures, aiming at top markets, recognizing "newsworthiness," and evaluating picture ideas, will draw "amens" from most free-lancers. The narratives behind the making and marketing of many famous and familiar pictures are fascinating reading for anyone interested in pictures. The book is indispensable for a free-lance just starting out; certainly worth reading for others.

PICTURE EDITING by Kalish and Edom (who is Associate Professor of Journalism at the U. of Missouri) is a book that fills a long vacant place in the teaching of photo-journalism. Designed primarily to serve as a text book and as a guide for picture editors of newspapers and small publications, it is a valuable and most significant book for the photographer who is interested in editing and editorial

Divided into two major sections, the first, "Pictures and Picture Editing," deals with what pictures can do in a publication, why special editors for pictures are necessary, and how picture editors work with photographers and other staff people. The PRINTS BY

second section of the book, "The Picture Editor at Work," deals with actual picture handling and explains lay-out, make-up, cropping, retouching, captioning, and use of resource materials and picture morgue.

Such mechanics as scaling and use of lay-out systems (the authors use and justify the modulus system) are explained in thorough detail and for the novice these tricks may well be worth the price of admission, alone.

For the picture editor, the discussion on establishing a "picture policy" and making it work is enlightening, and we applaud the recognition of the photographer as the "ambassador of good relations for the publisher." This book may be considered an important one, for it is the first on the subject, and is as up to date as tomorrow's pictures.-DBE, Jr., Courtesy ASMP.

BETTER THINGS FOR BETTER LIVING ... THROUGH CHEMISTRY

A Profile to Know

A Kodak Ektalux Flasholder is no modest violet. Across playing field, arena, or woodland glade, you can spot that distinctive profile at a glance. It identifies the proudest flash equipment that ever sped fine pictures to exhibition walls.

One lamp or seven, capacitor-fired in reliable "synch" at the liveliest speeds your shutter offers... Up to 120 feet of extension, in single line or V-formation... Off the camera, on the camera, in the wink of an eye ... A firm, hand-fitting saw-grip that completely supports the camera, leaving your right hand free to manipulate film, aperture, speed, and focusing controls. Rugged, lightweight accessories that solve almost any setup problem... solenoid or direct release... flash shutter or external synchronization. Extension units that stack and nest compactly in the carrying

case . . . Cords that coil smoothly without kinking . . . Complete equipment, with every detail engineered for fast, smooth, professional operation.

This is "flash grown up." This is Kodak Ektalux—modern professional flash equipment that every photographer who values his picture opportunities will want to know...and own.

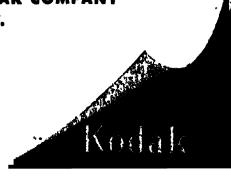

Priced from \$29.75 for Ektalux Flasholder with standard bracket and 15-inch bayonet connector cord. Kodak Ektalux Press Bracket, \$5.75. See it at your Kodak dealer's.

Prices are subject to change without notice.

HARRY YOURAN	

THE PRESIDENT REPORTS . . .

It is 9:40° and the desk has thirty-seven letters from PSA members and officers. It gets a fast run-through and only three will be answered today. They must have immediate answers, but the rest will wait until a bad day of figuring and talking to representatives of various printing and paper companies is over. Today—as in so many recent days—I am working exclusively for the Publications Committee.

Chairman Youran and the members of the Committee made certain demands last Friday evening, and those are orders. Our JOURNAI. has been costing more than we can afford—it is up to some of us to see what can be done about it, and something drastic has to be done and quickly.

This is the tenth such day in a row, but chough has been discovered to prove that we can have a good JOURNAL at little or no cost to the Society. The advertising has been going up and now the costs will come down—as they should.

When—and note the word is not "if"—we break even on the PSA JOURNAL, we can do a great many things at Headquarters that are now far beyond their ability. We need more capable hands at 2005—and I mean more of them. Those we now have are doing a grand job for us, but they need more help—and they are going to get it! It can and will be done as soon as the JOURNAL costs us less—or perhaps nothing at all—per year.

In the next month or two, there will be more news on all this. Stand by for good news!

But one letter demands an immediate answer. Boris Dobro and his crew in California have just staged a truly fine PSA event in their "PSA Town Meeting of Photography." Despite what Boris calls too much "liquid sunshine," hundreds of photography's wonderful people turned out to mingle with PSA's best on a day of interesting and exciting camera doings. Sponsored by PSA and the Southern California Council of Camera Clubs, the Town Meeting brought out most of the town and everyone had fun. Top and sincere con-

gratulations to Boris Dobro and all his faithful aids!

This important Day is especially exciting to me because it fits in so perfectly with my keen desire to have really important PSA events going on in every center of PSA population. The "Tops" show in its wanderings in the South this winter has proved that there are innumerable PSA'ers who are eager to put on programs which will interest the whole community. Now Dobro comes along with another kind of program that might be staged in any city or town in the U. S. A. regardless of the total population.

These events in scores of communities all over the country will furnish the backbone of PSA's strength because of their valuable contribution to photography and to the life of each city and town. That's another way of saying that we can accomplish much for both our country and our photography through the work of our Society at the local level.

We who have accepted office—another way of saying "taken a job"—on a national committee or other working level in PSA, are all looking for ways and means to increase general interest in photography—and incidently in PSA. Such programs—of great interest not only to PSA'ers but to the whole community—cannot fail to produce results if there are enough Dobro's and others who are willing to work out plans and carry through those already in existence. More power to them.

Here's the catch in all this. We need a lot of others who would like to do something constructive in their own towns. Maybe it is the "Tops" show, maybe a "Town Meeting" or regional convention or one-day seminar or a session of the National Lecture Program. Maybe it's an idea of your own that is still better—who knows?

If such a performance sounds interesting to you, sit down right now and drop me a line. PSA is a big thing—big and most important. It needs the best any of us can offer, and it pays off most to those who do most in the activities of the Society.

NORRIS HARKHESS

PSA JOURNAL, Vol. 18, April 1952

Wherever your photographic journeys may lead you . . . whatever your favorite subjects may be—the 2½ x 2½ HASSELBLAD Camera merits your interest. This is particularly true if you pursue your photographic work, and pleasure, with the practiced discipline of a perfectionist. For here is an instrument, precision crafted in Sweden, with built-in refinements that will bring a new range . . . a new sureness to your picture making. Interchangeable film magazines, interchangeable lenses, automatic controls, speeds to 1/1600 second, built-in flash — these are but a few of the features that make the HASSELBLAD a "must" for your personal inspection.

PRICES - The camera, with 80mm Kodak Ektar 1/2.8 Lens and 2½ x 2½ roll-film magazine, \$535 including Federal Tax. Accessory 135mm Kodak Ektar 1/3.5 Lens, \$250, and 250mm Zeiss Opton Sonnar 1/4 Lens, \$421.

NEW AIDS FOR BETTER PICTURE-MAKING

By JACOB DESCHIN, APSA

Now you can mix your own solutions for processing Diaversal paper. The Revere Camera Company, of Chicago, American distributors of the Belgian-made paper, have released the formulas which until now have been available only from Revere in prepared liquid or powder form. In case you have missed it, the Revere Wash-Off Negative Diaversal Enlarging Paper, to give it its full name, is a unique positiveto-positive material for making toned enlarged prints in a few minutes directly from . color transparencies, movie frames and stereo pairs. After exposure in an enlarger (a special outfit, Revere Cine Enlarger-Viewer, is sold for enlarging from 8mm or 16mm film frames), Diaversal paper is put through three solutions. The process consists of a first developer, which yields a negative; a second developer, which reverses the image to a positive after the temporary negative image has been washed off in a warm water, leaving a light-toned positive, and a toning bath which darkens the positive to produce the completed rotobrown print.

The bleaching solution formerly indicated has been eliminated, this step having been incorporated in the second developer, which contains hypo crystals. No fixing

is required and washing takes five to ten minutes. Ordinary darkroom lighting with an OA or similar safelight is required only for the first two minutes of the processing, after which the white room light may be turned on. After washing, the prints are dried normally.

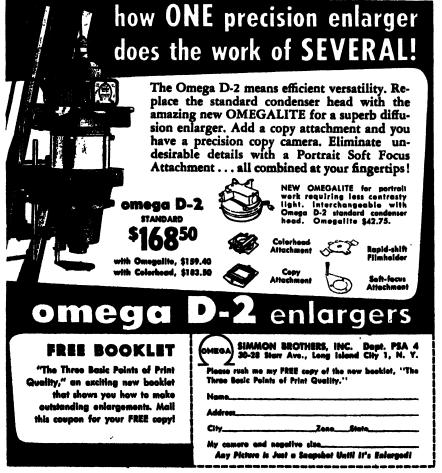

Revere announces the following formulas for processing Diaversal:

First Developer (G251):		
Water at 90 degrees F	32	oz.
Metol	53	gr.
Sodium sulfite, anhydrous	2	ΟZ.
Hydroquinone	210	gr.
Sodium carbonate, anhydrous	31/4	oz.
Potassium bromide	35	gr.
Water to make	80	oz.

Use without dilution: develop one minute at 60-68 degrees.

Second Developer:	
Water at 90 degrees	32 oz.
Sodium sulfite, anhydrous	4 oz.
Hypo crystals	180 gr.
Add First Developer	4 oz.
Water to make	80 oz.

Use without dilution: develop two minutes at 60-68 degrees.

Recommended Toners are as follows:

Eastman Rapid Selenium
Water at 60-68 degrees 32 parts
or
Ansco Flemish Toner
Water 60-68 degrees 40 parts

Tone one to three minutes at 60-68 degrees, the time depending on the depth of tone desired.

If a prepared developer is preferred, Revere suggests Dektol, or similar developer, diluted two to one, for the first solution; and Dektol two to one for the second developer, plus 54 grains of hypo crystals to 24 ounces of diluted tray working solution.

The latest kink in enlargers—a rangefinder for focusing! Honest. It's the principal gimmick of the Exact 66, a 21/4x21/4 enlarger just brought into this country from Germany by Burleigh Brooks Company, 10 West Forty-sixth Street, New York City. Made by the Veigel factory in Stuttgart, the new enlarger is designed to take 21/4x21/4 negatives and smaller. The rangefinder is available with lenses of various focal lengths and can be used for any degree of enlargement on or off the baseboard. Two light beams are projected as lines on the easel; as the lens is focused the beams move toward each other. When the two beams join, the image is in sharp focus. Other features of this \$169.50 enlarger include a double condenser matched to a Schneider Componar enlarging lens and a new type reflex lighting principle, of which the source is a projection lamp. The Exact 66 is compact, light in weight, with controls for raising, lowering and locking at the base, and enlarging magnifications of 11/2 to 7 times on the baseboard, higher ratios off the board.

Flash

A couple of new speedlights have been introduced recently. One is the Epco Electronic Flash Unit Model PD-400, the other the Shawlite Electronic Flashgun. The Epco, which is made by Epco Products. Inc., 2500 Atlantic Avenue, Brooklyn, includes a cold light tube with a long-life guarantee, a flash duration of 1/10,000th of a second, a light output of 120 wattseconds and guide numbers of 45 for color, 220 for fast panchromatic film, and costs \$160 for the complete outfit, which includes a genuine cowhide leather-covered carrying case, power pack, cold light bulb, seveninch aplanatic reflector and 20 feet of cord. The Epco may be converted in a few seconds for battery operation.

The Shawlite Electronic Flashgun, having a 60-watt-second output, said to be equivalent to that of a No. 5 flash lamp, is announced by Minifilm Camera Corp., 1190 Sixth Avenue, New York. The \$39.95 unit has a 1/2000th flash duration, weighs two pounds and operates on 110-120 AC. The unit includes a seven-ounce flashgun, complete with battery case, reflector and camera bracket, and an electronic tube yielding 100,000 flashes.

A. C. Muller, of 421 Seventh Avenue, New York, who has been synchronizing Automatic Rolleissex cameras for flash for more than four years, now announces a

Take what you see...then see **EXACTLY** what you take

Tr's amazingly easy to take beautiful, true-to-life pictures with the Stereo-REALIST — and as rewarding as a flower garden in full bloom. The REALIST exactly reproduces what you see with your eyes. So, if the original scene is pleasing, take it. When viewed in the REALIST Viewer it will be equally as pleasing.

And with the REALIST you don't have to fuss about perspective or composition . . . or memorize pages of algebraic formulae . . . or juggle a truckload of equipment. The REALIST does the work. YOU get the enjoyment!

REALIST pictures are a thrilling experience in lifelike three dimensions and glorious natural color. But, seeing is believing. If you haven't seen REALIST pictures, ask your camera dealer to show you some. See for yourself how you can "take it easy" with the REALIST. DAVID WHITE COMPANY, 387 W. your Standby for flash!

The New Leica IIf Box with Built-in Synchronization. \$139.40 (Incl., Fed. Tax). Leica Folding Flash Unit \$24 additional.

econd Leica *

without lens cost

Yes, you now can pair up the new IIf with your present Leica and get all the advantages of a "second" camera without the cost of another lens. By a simple switch of your present lens you can quickly change from natural lighting to flash exposures...shoot in either color or black and white... get fuller and far more versatile coverage of any scene or subject.

The new Leica IIf offers built-in synchronization timed exactly for all shutter speeds from 1/30 to 1/500... for all flash bulbs and zero delay strobe. It also features the new film-winding knob that "remembers" the speed of the film in the camera. May be converted easily to a IIIf model by factory addition of slower shutter speeds. Ask your photoexpert Leica Dealer for full details.

new installation: full synchronization at all speeds for all Rolleiflex cameras with rimset, delayed-action Compur shutters. The cost is \$40. He offers the same installation for other cameras with this type of shutter, including the Plaubel Makina and the Super Ikonta B and BX.

Designed for use with the popular miniature peanut flash lamps, the Bower Photo Flash Unit, recently put on the market by Saul Bower, Inc., 114 Liberty Street, New York, is måde of lightweight aluminum and costs \$6 for reflector, battery case, cord and camera bracket with screws. Versatility is provided by a tripod screw in the base of the camera bracket and, for cameras with a built-in shoe, by a clip at the bottom of the battery case.

A new B-C Flash Unit, Model BCB, for the Bolsey Models B-2 and C 35mm cameras, is announced by the Kalart Company, Inc., of Plainville, Conn. The unit includes the exclusive built-in test light and costs \$1430

The Amber Coated Dura-Flash lamp is announced by Dura Electric Lamp Company, Inc., of Newark, N. J. Designed to furnish color-corrected illumination without the use of auxiliary filters, the new lamps come in five types, the No. 5A, No. 6A (for small cameras with focal-plane shutters), the No. 11A and Nos. 22A and 50A, the latter for large coverage.

Cameras

Carl Zeiss, Inc., 485 Fifth Avenue, New York, importer of the Contax and Ikonta cameras, has entered the inexpensive camera field with the Box Tengor camera, a \$17 unit of the "deluxe box" type. Equipped with a two-element coated and color corrected f/9 lens, the camera uses 120 film for a yield of eight pictures, size 2½x3¼ inches.

The camera has three focusing distances, three lens stops, f/9, f/11 and f/16, and a constant shutter speed of 1/30th of a second, and bulb (time). The shutter is the rotary type with built-in flash. The company also announces the availability of the Zeiss Ikon Ikophot photo electric exposure meter with an accessory for incident-light readings. It is calibrated in ASA film values and costs \$28.

Saul Bower, Inc., of 114 Liberty Street, New York, has imported the Bower 35, a German miniature ranging in price, depending on the shutter, from \$36.50 to \$52.50. The Bower 35 has an f/2.8 Steinheil Cassar coated lens and comes equipped with any of four shutters, the Vario, with speeds from 1/25 to 1/200 and bulb; the Prontor S, 1 second to 1/300 and bulb with built-in self timer; the Prontor SW, same as the Prontor S but with flash synchronized at all speeds; and Compur Rapid MX, 1 second to 1/500, bulb, flash synchronized at all speeds. The Bower 35 is small, light weight, and has a de-cast aluminum body finished in black with chrome trim.

Bower also has a Bower Ball Titt Tripod Top with unusual locking features. Imported from Germany, the top comes in three sizes and is priced at \$2 to \$3.50.

The thirteen Camera Craft stores, with headquarters at 18 East 42nd Street, New York City, announce two items. One is

PSA JOURNAL, Vol. 18, April 1952

.... another way LEICA makes better pictures easier.....

New B. C. Unit for Uniform Flash

Fits easily into any Leica Fold-ing Flash Unit \$3.85 including battery

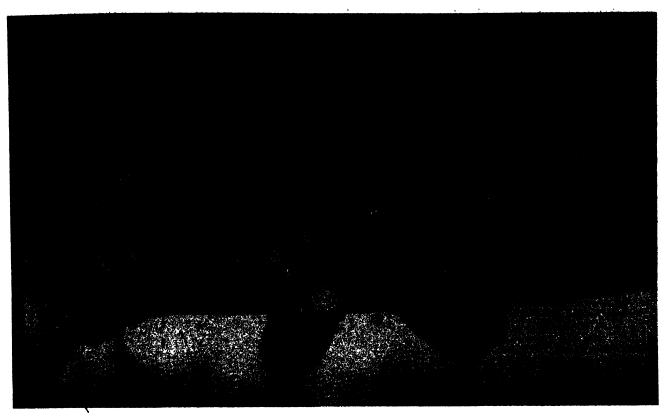

A remarkably new, more powerful and dependable firing system for Leica flash shooting. In between shots, its special condenser "stores" energy from a single, small 22½v. battery for a uniform, high-voltage firing impulse. Discharges force 15 times stronger than usual ½v. flashlight battery:

- provides more even illumination at flash peak.
- simplifies use of extension units for multiple flash by eliminating slowed timing.
- makes battery, contact and temperature conditions less critical, firing more dependable.
- single long-life battery means extra convenience and economy.
- now standard equipment for Leica Folding Flash Unit.

Dull day "sunlight." See how photographer George Miller has used G-E Midgets to create the effect of sunlight, giving the picture extra form and sparkle. Try 'em in sunlight, to soften shadows on faces.

When Not Posing makes a Better Picture!

G-E Photoflash lets you shoot fast

You just can't make young pups hold still and "watch the birdie!" But don't worry about that when taking pictures with General Electric Photoflash. Because G-E Photoflash (Midgets or other sizes to fit your camera) provides a punch of light to capture every detail and, most important here, really "stops" the action of jumping, wiggling, clawing, yelping. Result: a much more interesting picture because it is candid.

For shots like this—and for so many others indoors or out, day or night—G-E Photoflash is the answer you've always wanted for making certain that your precious pictures come out fine! Buy G-E Photoflash at your photo dealers. And keep plenty handy for every occasion!

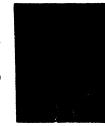

Remember, there's a G-E lamp for every photographic purpose

Develop Your Prints With the Same

Care You Give Your Negatives

by Dr. Edmund Lowe, APSA

Some paper developers produce beautiful tones and some do not, therefore, selection of the right print developer contributes as much to the success of your picture as proper negative development.

For years Edwal chemists have sought the best combinations for producing beautiful tones—experimenting with hundreds of developing agents, anti-fog agents, pH values and concentrations. Research was not restricted to cheaper metol-hydroquinone mixtures, but included more powerful and more expensive compounds long favored by great photographers.

Today Edwal offers 2 superior paper developers (both without hydroquinone, chief cause of aerial fog) actually LOWER IN PRICE than metol-bydroquinone liquid developers because their greater concentration allows lower packing and shipping costs. Try them today!

Edwal 111, "platinum tone" developer, produces unusually beautiful "silvery" blacks (especially on Varigam) in portraits, landscapes, pictures to "live with" in the home. We recommend it for all personal pictures where cold blue blacks are not desired. One quart bottle makes up to 2 gal. of working solution.

Edwal Velvet produces cool rich blacks on "cold tone" papers; warm blacks on papers such as Opal, India Tone, etc. Velvet is today the LEAST EXPENSIVE liquid paper developer, though made with costly chemicals. Because it is extremely concentrated, the 99¢ 16 oz. size makes 1½ gallons of full strength developer!

SPECIAL SAMPLES to Camera Clubs and Schools

Edwal offers special samples to accredited camera clubs, universities, photo schools. Send us the number of members in your club or class, and the name of your most convenient photo supply dealer (mention this magazine). We'll do the rest.

SCIENTIFIC PRODUCTS CORP.

the Proximeter, a close-up focusing attachment for focusing and viewing miniature camera subjects as near as ten inches without the usual adjustments. The device offers three close-up ranges and accommodates models of the Leica, the Kodak Retina and the Agfa Karomat. For the Leica, the Proximeter is \$24.95, for the Retina \$19.95.

The other exclusive Camera Craft item is a complete, low-cost kit for making color prints by the Dye-Transfer process, costing only \$37.50. The kit contains all the necessary materials including the Condit Registration Easel, a custom-made device for accurately registering the transferred matrices, and a set of triple-masked, balanced color-separation negatives for use as a guide in making sets of negatives.

Ansco Color, daylight, and Ansco Supreme, a medium-speed fine-grain panchromatic film, are now available in the popular 828 size, which yields eight pictures size 28mm x 40mm to the roll, which is slightly larger than the conventional 35mm film. The color film is 98 cents a roll, the black-and-white 48 cents.

The three-section Empire Hi-Riser Tripod is announced by Service Photo Suppliers, Inc., 151 West 19th Street, New York City, at \$32.50. The new tripod has an adjusting ring for snugly fitting the camera tripod thread; an efficient panning handle; a tilt lock to permit the camera to be moved horizontally only; a handle, which folds when not in use, for adjusting the height of the elevating column, and other conveniences.

A 7½-inch, 7-ounce camera support designed for tabletop and similar photography, has been put on the market by Exakta Camera Company, 46 West 29th Street, New York City. The \$3.95 device consists of a clamp and universal head, can be fastened quickly and firmly to a table, a chair, door, etc., is made of aluminum alloy and has American and European tripod bushings.

A new plastic lightweight Stereo Slide Mount for standard 35mm viewers and projectors is offered by Holson Binders, Inc., 762 Wythe Avenue, Brooklyn 11, N. Y. Each film frame, as it is cut, is slipped into a transparent plastic envelope, then into a slot in the mount, making possible the mounting of a complete roll in about ten minutes. A package of sixteen is \$2.48; 100, \$15.

A single-tier all-steel file for stereo slides has been introduced by the Brumberger Sales Corp., 34 Thirty-fourth St., Brooklyn 32, N. Y. The file takes fifty metal or glass slide binders divided into five groups or up to 125 cardboard mounts. The file has a recessed handle, snap catches, numbered strips and an index card.

A new film and paper fixer that contains an aromatic oil of lavender derivative, that takes out the strong acetic acid and sulfite odors usually associated with acid hypo solutions, has been placed on the market by du Pont. It is the 18-F Universal Fixer, a single-powder hardening fixer that is mixed easily and has a long service life. It is designed particularly for darkroom work in homes, office buildings and similar places.

A file for 35mm slides that looks like a leather-bound volume, the Dias Slide File, recently introduced by Camera Specialty Company, Inc., 50 West 29th Street, New ~ York, measures \$x10 inches, holds 100 glass slides or 200 ready-mounts, and costs \$7.50. It is made of dovetailed hardwood fines, is bound in leather and has a natural wood finish.

A new 90mm f/1.8 Angenieux telephoto lens for the Exakta camera and designed for use under difficult lighting conditions indoors, is announced by Exakta Camera Co., New York. The price is \$149.50.

A new Exposure Dial Calculator for indoor movies and still photography is now included with all Mayfair portable lighting units.

One of the handiest devices we have tried in a long time is the new Polaroid desktop Copymaker (\$67.50) pictured above. For use with the Polaroid Land Camera, it turns out clear, dry, finished copies of documents, letters, sketches, drawings or photographs in a minute. It can be used for close-ups of machine parts and other small objects up to 11 x 14 inches.

Completely self-contained, it incorporates polarized illumination, automatic indicating scale, exposure guide, electric timer, adjustable platform, and circular fluorescent bulb.

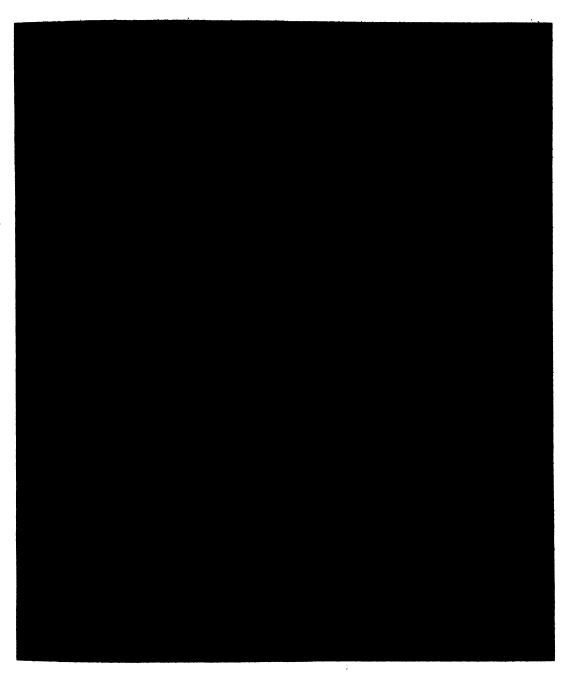

OFFICIAL NOTICES

The following proposed amendment to Article XVII, Section 1, of the PSA Constitution and By-Laws, is published herewith as required:

Delete the present Section 1 and replace it with the following: "Cask. All funds of this Society shall be deposited in banks which are members of the Federal Deposit Insurance Corporation in the name of this Society and subject to checks signed by either the President or the Treasurer, both of whom shall be bonded, with any other of the elected officers or the Executive Secretary or Office Manager as co-signer under the rules and regulations prescribed by the Board of Directors."

Technical Exhibit Travelling Show

The PSA Technical Division announces a new Travelling Print Show, containing outstanding examples of scientific and technical photography. Within the limit of the number of hangings that can be arranged in a period of about 18 months, this Show will be loaned to technical schools and societies for periods of a week or so at no charge, except one-way shipping costs.

The Travelling Show contains about thirty-five 16 x 20 prints, which were selected from the 7th Open Exhibit of Technical Photography, held in Detroit last October. In the main they represent interesting examples of the ability of the camera to capture and record technical information that escapes the eye.

Conditions for borrowing the Technical Print Show are simple. Public hangings are given preferred consideration. prints, on 16 x 20 mounts, should be hung under glass for protection. Each group borrowing the Show is required to ship the prints promptly at their own expense to the next location. The Show will be available for hangings through June 1953. Requests should be sent in writing to Earl R. Clark, 184 Malden Street, Rochester 13, New York, and should state any preference for dates.

Progress Medal to Johnston

The Council of the Royal Photographic Society of Great Britain has awarded the Society's Progress Medal, its highest award, to J. Dudley Johnston, Hon. FRPS, in recognition of the invaluable services he has rendered to the Royal and to the advancement of photography, particularly in the pictorial field.

Mr. Johnston was the recipient of the PSA Progress Medal Award in 1949.

Whitesell Prints Available

An unusual opportunity is available to PSA members to obtain original salon prints by one of the world's greatest masters of group photography at the low cost of ten dollars (\$10.00) each. Pops Whitesell. FPSA, has made up a number of his more successful exhibition prints, and they may be obtained direct from him at 726 St. Peters Street, New Orleans, La.

Those who would like to have an original 16 x 20 dye transfer print portraying Pops

PSA CONVENTION COMMITTEES ANNOUNCED

JOSEPH A. BERNSTEIN

Specific plans for this year's vacationtime convention of the Photographic Society of America, to be held in New York City, August 12th through the 16th, are beginning to jell, though six months remain before the call to order.

Deadline for all entries in the Annual PSA International Exhibit, which will be the first in the history of the convention to be held under the same roof as convention sessions, in Hotel New Yorker, has been set for July 10th.

Judges have been named for four of the seven divisions—one more than ever before—to be represented in the annual exhibit. The four divisions are Color, Pictorial, Nature, and for the first time, Stereo.

Motion Picture and Photo Journalism exhibits are to be invitational. The seventh group, the Technical Division, will assemble and judge its entries separately.

Complete information on the exhibits, as announced by Carl Sanchez, Jr., chairman of exhibits and Harry Youran, publications chairman, is tabulated elsewhere.

Divisional chairmen were making rapid progress toward, completion of their respective programs. Among early reports comes one from Paul Wolf for the Color Division. Included in this program will be a showing of a 16mm color film on Photomicrography and Photomacrography entitled "Natures Highlights," by Joseph T. Fox, APSA, FBPA, whose film was accorded a special award by the Biological Photographers Association this year. Another feature will be a much needed discussion of Color Filters by Charles A. Kinsley, APSA.

As programming moved toward completion Quested Elgar, in his role as chairman of convention housing, began to tackle the problem of allocating space and time to divisional and special meetings. He urged earliest possible filing of requisitions to insure smooth allocation of the ample space available in Hotel New Yorker.

In his role as president of the Metropolitan Camera Club Council and therefore official host to the convention, Mr. Elgar is assisting Paul Gibbs, New York chairman, in arranging a remarkable program of hospitality for visitors.

The New York committee is especially anxious to provide every facility for the comfort and convenience of convention visitors in view of the fact that the Metropolitan area, with its vast variety of photogenic subject matter, is showing signs of luring more photographers to the convention, earlier, than ever before. Many already have made it clear that they plan to come to New York early and stay after the close of the convention to combine the opportunity afforded for making pictures in a new and varied scene, with attendance at the convention.

In preparation for this, the New York general committee has been expanded until the number of Metropolitan area photographers new at work preparing for the visitors is growing well beyond the 200 mark.

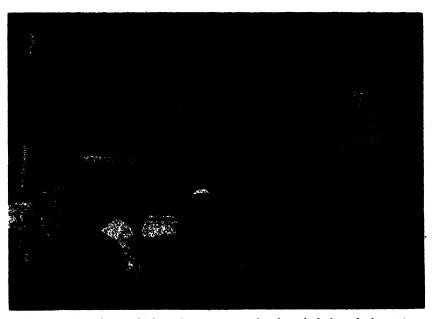

A corps of PSA members who are prominent as judges and speakers at meetings of the 100 and more Metropolitan camera clubs, are spreading the gospel of PSA under the direction of Al Schwartz, chairman of the convention membership committee. Results of their efforts are being felt in terms of new members for PSA and also in terms of volunteers to help the growing general committee prepare for visitors.

This "personalized field trip" service is planned by the New York committee to be available before and after the convention

PSA CONVENTION OFFICIALS—Norris Harkness, Pres., (left); Quested Elgar, Pres. of the host oganization, the Metropoliten CC Council; and Paul Gibbs, General Chairman.

General Chairman Gibbs urges convention visitors to come early, register the first day of the convention, and stay late, promising a type of hospitality that will exceed that of his own famous native

The Battery from Statue of Liberty Boat—a view to be photographed on the boat trip.

as well as during the five days of the sessions. It is in addition to the now rapidly developing major convention field trip being planned under the direction of Edward C. Wilson, chairman of the special events committee. He is chartering a boat to take photographers on a picture making tour of the New York harbor and waterfront.

With the goal of the reception committee aimed at converting the convention "into one big happy family," Olga Irish, chairman, has enlisted PSA members from all parts of the country as well as from New York to help introduce everyone to everyone else.

The special services committee, headed by Ed Bailey, already has launched a survey of the equipment and convenience requirements of every speaker and demonstrator with a view to making this convention the smoothest functioning one on record. His aim is to furnish the needed lights, flexible wiring, tripods, projectors, light boxes, screens, switches, even floor plugs, for every demonstration at the right place and at the right time.

southland. And to prove it, he is planning a reception for the first evening of the convention that will be unique in the annals of photographic holidays.

Camera Club Manual

H. J. Johnson, FPSA

The first portion of this installment concludes Chapter III. It is followed by Chapter IV, which will be concluded in next issue.

Organization for Meetings-

Organization of club officers and members for planning and conducting meetings depends upon (1) club organization as provided in constitution and by-laws, (2) size and objectives of the club, and (3) type of meeting schedule desired.

If the club is of the type which seeks to have every member active, appointment of multiple committees should lighten this work and contribute to club programs. If the club is limited in membership, the responsibilities must fall upon individuals, or upon a few.

Ideal organization for planning and conducting meetings might be as follows:

- Executive Committee comprised of club officers and chairmen of committees, meeting at least monthly to (a) conduct routine business, (b) plan club schedules, and (c) guide club affairs.
- Program Committee, responsible for planning meetings, obtaining speakers.
- House Committee responsible for care, and use, and timely availability of club equipment.
- Activities Committee responsible for club projects and activities such as field trips, special events, annual dinner, year book, etc. (In some clubs these projects are directed by the Program Committee, which may appoint sub-committees to handle special projects.)
- Competition Committee responsible for conducting monthly contests, annual shows, interclub competitions, and club participation in outside contests, exhibitions, etc.

These committees meet separately to plan and conduct their several responsibilities. Their chairmen, as members of the Executive Committee, are constantly in touch with all club affairs, and can present the wishes of club members, and of committee members, to the Executive Committee. In this way, the officers of the club may coordinate all programs and activities.

Meeting Programs

The nature of programs presented at camera club meetings is as diverse as are the clubs, their characteristics, and the imaginations of their officers. No program or list of programs exactly will meet the needs of all clubs, but programs which have been tried successfully are as follows:

- 1. LECTURE. Formal or informal, on any photographic subject (prints, slides, movies, depending on the chief purpose of the club).
- 2. DEMONSTRATION, of any product, process, or method, in any of the photographic fields in which the club is interested.
- 3. EXCHANGE NIGHT. Two or more local camera clubs hold a joint meeting. Useful particularly in hearing visiting speakers of note, or in pooling financial resources to obtain outstanding speakers.

- 4. ANALYSIS NIGHT. Members bring pictures which they desire to have analyzed by competent critics. Each member exhibits prints or slides, tells objective and explains process.
- 5. TRIAL BY JURY. This is a criticism program in which each print or slide is assured positive statements of good and bad features and then a decision as to which outweighs the other. As each picture is presented, a "prosecutor" looks for the weak points, then the "defense attorney" looks for the good points, and finally a "judge" summarizes his "decision" on the basis of the arguments presented. Select prosecutor, defense attorney, and judge well in advance and have a short rehearsal. (A "sergeant-at-arms" times each argument so that "prosecution" and "rebuttal" receive equal time.)
- 6. AUDIENCE PARTICIPATION PROGRAM. See Chapter III. Properly handled, this is the most beneficial type of criticism program.
- 7. TECHNICAL PROGRAM. Expert in scientific phases of photography makes non-technical talk or demonstration on theory or practice in some branch of the science.
- 8. INDUSTRIAL NIGHT. Industrial photographer describes use of photographs and of photographic processes in industry.
- 9. SCIENCE NIGHT. Dentist, doctor, or technician describes nature and use of x-ray and other types of pictures used for scientific purposes.
- 10. NEWS PICTURE NIGHT. News photographer tells of work and methods.
- 11. PORTRAITURE NIGHT. Outstanding portraitist, amateur, or professional exhibits and explains work.
- 12. CONTROL PROCESS PROGRAM. One or more experts in various control processes explain or demonstrate their methods. May be varied by giving identical negatives to each expert in advance of meeting and asking each to exhibit a print made from the negative, using his process. Each expert explains benefits of control process and how print thereby was improved.
- MAKE-UP NIGHT. Informal lecture and demonstration of photographic make-up materials and processes.
- 14. MODELS NIGHT. The club furnishes models and lights and under supervision of an experienced photographer, members try their hands at "model" photography. The models may be "costume," "character," or "nude," though the latter should be restricted to advanced workers and arrangements carefully supervised. For best results, give each member a specified amount of time in a predetermined sequence.
- 15. STUDIO NIGHT. Meeting is held in studio of professional, commercial or portrait photographer, who explains use of equipment, nature of work, discusses problems and exhibits pictures.
- 16. STILL LIFE NIGHT. Lecturer, or member of the club, demonstrates ways of selecting, arranging, lighting, and photographing still life subjects for color or monochrome.
- 17. GADGET NIGHT. Club members exhibit and demonstrate their most useful photographic gadget, showing benefits, how made, how employed.
- 18. SWAP NIGHT OR AUCTION NIGHT. Club members bring photographic equipment they wish to sell or trade, turn it over to "auctioneer," naming price. Auctioneer exhibits and comments humorously on each item, asks bids to buy and offers to swap. On sales, club may keep a percentage as sales commission.
- 19. QUIZ PROGRAM. Photographic question-and-answer program held by club members, or developed by inviting team from another club to compete. Joint committee representative of participating clubs prepares questions, selects interlocutor and judges, decides details, all in advance.
- 20. PHOTOGRAPHIC LITERATURE PROGRAM. Selected members of club review new photographic books and present out-

line and gist at meetings; or members are assigned to read certain photographic magazines and to present brief or selected articles.

21. ARTIST'S NIGHT. Photographers can learn much from the artist and each club will find it stimulating and profitable to include somewhere in its season a talk or demonstration by an etcher or painter.

22. LADIES' NIGHT. Entire meeting program is planned and conducted by women members of the club, with woman guest

speaker.

23. MOVIE NIGHT (for other than movie clubs). Club members who use motion picture camera present their best films. Or in a movie club, slides can be substituted.

24. TRAVEL SHOW NIGHT. Prints or slides from travel shows are exhibited singly and discussed by experts or members.

25. CONTEST NIGHT. It is usually better to have contests as part of a program for change of pace and greater interest. For example, a speaker on the first part of the program, followed by a contest. But major contests can properly constitute an entire program, especially when the number of entries is expected to be large.

Member clubs of the Photographic Society of America, may, upon occasion, obtain speakers through the Society. Also available are individual shows, travel shows (prints and slides), print and slide circuits, instruction sets with tape recorded text, movies, etc.

Clubs planning programs also may obtain features in the way of lecture material, still and motion pictures, and transcribed talks from camera equipment manufacturers. These industrial features customarily are accompanied by product advertising and frequently may be obtained through local camera stores, dealers, and branch offices of manufacturers.

Chapter IV * Camera Club Activities

Camera club welfare demands continuing programs of activities which keep members interested, busy, and making progress in photography. The nearer the club can come to having every member busy with one or more club activities, the more successful it will be. The more that club activities benefit members by improving their skill and increasing their knowledge of photography, the better the club serves its purpose. In fact, the more the club works towards the objective of lifting the photographic capabilities of all members to a selected par, the better the club spirit and the happier the club.

Meetings are the more obvious and routine club activities. They are helpful, but insufficient to build and to maintain strong, progressive clubs. Meetings addressed by accomplished speakers contribute to members' knowledge of photography, but only indirectly to the development of photographic ability. Merely to discuss photography is so easy, so inviting, and so deceptively helpful that club members readily yield to the temptation to become "talking photographers."

Practice Necessary

Vicarious enjoyment of photography seldom produces real photographers. Needed are club activities which induce and encourage members to use their cameras and darkrooms and competitively to develop necessary skills. Organization of club activities permits the club membership to be divided into groups by selection of interests, and these smaller groups to be encouraged to make actual use of their abilities and equipment for self-improvement.

Activities may be (1) regular, (2) special, or (3) seasonal, and either indoor or outdoor. Since the nature

and purposes of club activities must be governed by club needs and interests, no one group of activities can meet all the needs of every club. Selection may be made from such possibilities as Field Trips, Portraiture, Process and Control, Nature Photography, etc.

Special activities may include members' participation in any special events in the community or in occasions developed by the club. Seasonal activities may provide for snow photography, making Christmas cards, etc.

Activities obviously are supplementary to club meetings. They may be planned not only to further club interests and characteristics, but to aid in developing club meeting programs. The size and nature of the club are important factors. A large club can develop and maintain an extensive and widely varied program of activities. The small club, lacking manpower, must be content with a less ambitious program.

Selection of activities may be made on the basis of the interests, desires, and needs of the membership, as well as by vote. The club which has in its membership, or can obtain the services of, an expert portraitist, may make portraiture a strong activity and develop the interests and skills of its members along this line. The club whose members are amateurs equipped with roll-film box cameras must limit its activities to the possibilities of the equipment. The club located in an industrial community may be interested in industrial photographs, or its members, perversely, may be more interested in pictorialism. The club surrounded by picturesque and historic buildings naturally may turn to architectural photography, although club officers may find that members, tiring of that phase of the art, would like, and should be encouraged to take up some other subject.

Meet Members' Needs

Whatever activities the club selects should be those which meet the needs of club members. The club whose members are unlucky in their exhibition efforts may wish to improve its average by undertaking exhibition activity on a large scale. The club whose members are producing work which is becoming typed may wish to undertake activities which will lead to active interest in other subjects.

Success of club activities depends upon (1) executive direction, (2) number and interest of members participating, and (3) enjoyment and benefit afforded. Proper executive direction calls for general supervision by the club president or executive board, proper conduct and leadership of activities by appointed officers, committees, or members.

In a small club with a limited program, special activities may be directed by the Program Chairman, either personally or through appointed subordinates. In the larger club, it may be advisable to appoint a special committee or chairman for each special activity. If the chairman is interested and skilled in the activity, he will naturally attract larger participation. The large club thus may maintain a number of different photographic activities, each led and directed by a specialist, and each interesting a large group of members.

From these activities may come programs for meetings. In fact, it may be good management to correlate meeting programs with activities and vice versa.

Encourage Photography

The natural, simple way to inaugurate a program of club activities is to develop an event which calls for all members simultaneously to use their cameras. A regular meeting with a talk on still life photography may be followed by a studio session on still life. On this occasion, members bring their equipment, actually make still life pictures, and reveal, by their interest, how many would be good candidates for a Still Life Activity. If sufficient numbers demonstrate their interest, development of the activity calls only for appointment of the activity leader and enrollment of club members as participants.

Each activity may be directed by an appointed leader, who thereafter is responsible for arrangements, supervision, and conduct of the activity. He should be a person possessing leadership qualities and having organization and administrative ability, as well as imagination. In effect, he is responsible for the success of a cross-section of club endeavor.

Each activity leader should have the authority to call and to hold meetings of the members interested in the activity, to plan special events, to promote the social life of the activity, and otherwise to assure the success of the undertaking. While the activity's undertakings should be correlated with the club program to avoid conflicts, at the same time it should have a certain amount of autonomy.

It should not be overlooked that the promoting and conducting of the club's special activities provide excellent training for future club officers. Since the forward-looking club will wish to change officers with frequent regularity, regular development of ability to manage club affairs is essential.

Administration of activities requires recognition of members' limited time, facilities, and financial resources. Effective administration demands also a continuing follow-up system, so that pictures made on a field trip, for instance, are completed and exhibited at a stated and early date. Cost of activities should be kept at a level which invites member participation. Social values of group activities should not be overlooked, and the meeting of the activity, like that of the club at large, well may end with refreshments and get-togethers.

Organizing Camera Club Activities

Regular activities may be organized on a continuing basis and be directed each by a standing committee. Each activity may develop its own program, hold separate meetings to supplement regular meetings of the club, and, on occasion, contribute the regular meeting program along the lines of its special interest.

Regular activities may be concerned with those more essential phases of photography which, being basic, are of fundamental importance in the training of photographers. The nature and number of regular activities may be measured by the size of the club and the interests of the members.

It is unnecessary for any club to conduct all activities simultaneously. Interests of members may dictate that certain activities be undertaken in one year, others in the next year. The value of organization for activities is such that the members' current interests are served. The activities program, changing year by year, provides new interests.

Special activities are those which, temporary in nature and occasional in occurrence, are planned and directed by temporary committees or chairmen. Special activities are suitable for any club, regardless of size. They are virtually endless in variety and purpose. Being temporary, special activities are excellent for experimentation. If the activity proves to be popular, it can grow naturally into a regular activity. From among those members most interested, standing committee and chairman may be selected.

It is possible that a camera club activity may grow from a special meeting program, such as any of those listed in the chapter on Camera Club Meetings. For example, a Color Slide Night (in the case of a black and white club) may lead to a Color Slide Activity, and then develop into a Color Section of the club. A similar sequence for color prints in a color slide club may lead to a Color Print Section in the club.

Distinction between camera club activities which may be considered as regular, and those regarded as special, rests with the individual camera club. Furthermore, it may be found that some activities hereafter suggested appear to conflict with program features previously outlined. This is natural because a feature which may be utilized for a meeting program by one club well may be adopted or adapted as a regular or special activity by another, or even by the same club.

Experienced club executives will find that features of meeting programs and activities are fully supplementary. A meeting program can develop from an activity, and an activity may develop from a meeting program. This development avoids the dangers, real or imaginary, of forcing program features, or activities, upon club members. At the same time, it avoids embarrassment for club officers who seek to ascertain, by vote or by expression of opinion, exactly what the members would like to undertake—and are greeted either by bedlam of confusing and competing suggestions, or by dismal silence.

One great value of the separate, organized activity, either regular or special, is that it permits groups of members who have common interests to indulge those interests without consuming time at meetings or otherwise imposing upon other members. Nothing can be more fatal to the success of camera club life than conflicting interests lacking outlets. If 10 members are interested in portraiture, while 10 others crave abstracts, the club obviously has within its membership two regular activities struggling to be born. The way is clear to provide for each group of 10 exactly what it wants and thus keep club members busy and interested.

In fairness to all club members, no one activity, either regular or special, should draw exhorbitantly upon the club treasury. Special activities in which the entire membership is invited or has opportunity to participate will represent an approved charge upon the club treasury. On the other hand, either regular or special activities in which for any reason, only a few members participate, should be self-financing. To make such activities self-financing, furthermore, is a guarantee that the undertakings will be neither excessively expensive nor a drain upon the club treasury. On the other hand, the club might properly contribute to the initial or operating expenses of activities which supply programs for meetings.

(To Be Continued)

PHOTOPROGRESS IN 1951

GLENN E. MATTHEWS** AND WILLIAM F. WALKER

In the first year of the latter half of the twentieth century, an ever-expanding use of photography was noted in many fields of endeavor. More color photographs were being taken by the amateur and the professional than theretofore. A wide variety of equipment of both domestic and foreign manufacture was available in limited supply. Industrial, military, documentary and scientific photography showed steady growth over previous years. Although the motion picture industry appeared to be undergoing a period of retrenchment, rapid strides were evident in the use of photography in television. Steady progress was reported in the application of photography to nuclear physics.

Amateur Still Photography

In the United States, the Argus C-4 miniature camera, equipped with a new behind-the-lens shutter, had a superimposed-image type of range finder with a large eye piece to accommodate the wearers of eyeglasses. A special model of the Bolsey B 35mm Camera was introduced with a specially designed, removable shutter-lens assembly for close-up photography. The Kodak Signet Camera replaced the Kodak 35 Camera and featured a coated Ektar 44mm f/3.5 lens and a Synchro 300 shutter, the latter with four speeds from 1/25 to 1/300 second.

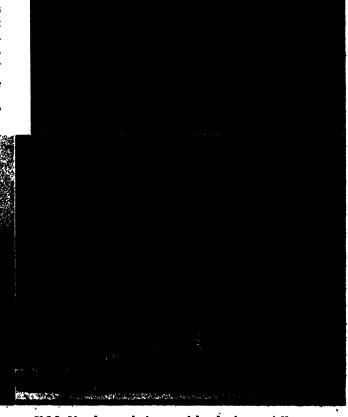

In England, the Witness 35mm precision camera was announced as having advantages not previously brought together in any one such instrument. In addition to a coupled-film transport, shutter wind and exposure counter, it included a combined range finder and view finder, re-

movable back and full synchronization for electronic flash and for conventional flash up to 1/1000 second. Another interesting British miniature camera was the Cyclope, in which the film passes along the front inside surface of the camera, under the rear element of the lens. Two mir-

rors bring the image onto the film.

The misapprehension that all German cameras are in the upper price brackets was being steadily discounted. The German American Trade Promotion Company revealed that 52 percent of all German camera production involved fixed-focus cameras, whereas cameras selling higher than 70 dollars represented only 8 percent of manufacture; about 200,000 cameras were produced each month, 8,000 of which were of the reflex type, 15,000 of 35mm design; and about 50 percent of all German production was exported. The Kodak Retina IIa Camera was made in Stuttgart and featured a Schneider Xenon f/2.0 Lens; Synchro-Compur Shutter with speeds to 1/500 second; coupled, superimposed-image type range finder; thumb-lever, rapid-film advance; and automatic shutter cocking.

Other new German miniature cameras included: a new model Robot Camera, the IIa, featuring two flash contacts on the body of the camera; the Contax IIIa, with a built-in photoelectric exposure meter; the Exa, a smaller and a less expensive version of the single-lens reflex Exakta; the Iloca I and II, the Regula II, and the Futura cameras.

Interest in the Japanese Nikon 35mm Camera and Nikkor lenses was heightened by favorable reports on them by Life Magazine photographers covering the Korean fighting. The Nikon Camera looked like the Contax and included important features of the Leica and the Contax as well as some innovations of its own. The Nikkor lenses were of four focal lengths: 50mm f/1.4, f/2, and f/3.5; 85mm f/2; 135mm f/3.5; 35mm f/3.5 wide angle.

Among roll film cameras, the Japanese Ricohflex was introduced. One of the lowest price 2½-by 2½-inch twinlens reflex cameras ever offered, the Ricohflex used No. 120 roll film and was equipped with coupled 80 mm f/3.5 lenses.

Other roll film cameras made available in the United States included the German Bower-X, Penta-Reflex, and Weltax cameras, and the Italian-made Elioflex. The Primar-Reflex II was a single lens, roll film (or sheet film) camera featuring a Zeiss prismatic housing for direct view focusing which snaps on or off the camera.

A convenient reference to the cameras being sold in Europe was published by Photo-Technik und Wirtschaft (2:192, May 1951) in the form of a list of the cameras

(2:192, May 1951) in the form of a list of the cameras exhibited at the Cologne (Germany) Exposition.

One of the major developments in photographic acces-

One of the major developments in photographic accessories was the battery-condenser (B-C) equipment for flash photography. Originally announced in 1949, the combination of battery and condenser can replace conventional dry cells as a source of energy for firing flash bulbs. In 1951 battery-condenser flash units were being manufactured by at least twelve companies for use on almost any type of amateur or professional still camera. For example, the new Kodak Ektalux Flasholder utilized the B-C system, and could be used on standard cameras, press cameras, or Polaroid-Land cameras, and adapted to many existing solenoid synchronizers by means of adapters especially made for the purpose.

A popular lens for press type cameras, the Kodak Ektar Lens, 101mm f/4.5, was made available mounted in the Kodak Synchro Rapid 800 Shutter for use on any 21/4- by 31/4-inch camera taking interchangeable lenses.

Among new German lenses, the Schneider Xenon 50mm f/1.9 and the Schneider Xenar 135mm f/4.7 in an in-

ternally synchronized Compur Rapid Shutter were announced. The 50mm lens included a preselector that allows focusing and composing at maximum aperture, following which the diaphragm can be closed down to a previously selected aperture setting. This stop preselector was also added to Xenon f/1.9 and f/2 lenses for the Kine Exacta Camera and Sonnar f/2.8 and Zeiss f/4 lenses. [Phot. (London), 6:32, May 1951].

A new Dutch telephoto lens, the Fototel, was a 450mm f/5.6 lens of novel design that consisted of a spherical concave surface mirror, an achromatic surface mirror and a convex surface mirror on the front lens element. (Phot.

Trade News, 14:62, June 1951).

At least two new 2- by 2-inch slide projectors appeared worthy of note. The Kodaslide Merit Projector featured a vertical slide feeding mechanism. The Port-A-View slide viewer for 35mm films was said to be the smallest film viewer of its type available. A self-contained unit of the table viewer type, the Port-A-View was made up of a light source, slide changer, optical system, and 6-inch square screen.

The Polaroid Company announced a new film, Type 420, which produced positive transparencies instead of paper prints. Intended for use in the Polaroid-Land camera, the film was said to have an exposure index to daylight of 100.

At least four new photographic papers were also made available: Du Pont High-Speed Varigam Paper, which is used with different filters to make prints from almost any negative; Kodak Mural Paper, which can be folded or creased without damage and is single weight so that overlapping joints in photomurals will be less conspicuous; Kodak Ektalure Paper, a warm-tone portrait paper; and Kodak Medalist Paper.

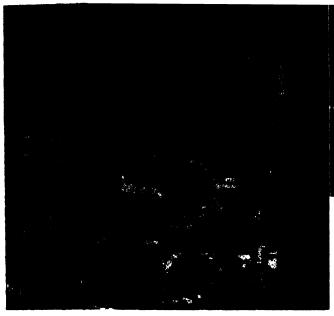

The Grant Photo Products Company, Incorporated, introduced Quiz Paper which had the developing agents in the emulsion coated on a waterproof base. Processing consisted of immersion in a sodium hydroxide solution followed by a stabilizing bath and required a total time of about 5 seconds. (Mod. Phot., 15:46, July 1951).

The manufacture of photosensitive materials as usual had its problems. H. R. Sprentall published a paper concerning the evaluation of film quality in which he examined the factors that affect the quality of a negative as produced by the photographer, all the way from the manufacturer's considerations of latitude and consistency to the individual's exposing and processing techniques. (PSA Journal, 17:459, July 1951.

The Korean fighting and the requirements of the national defense program led to the renewal of the World War II request that photofinishers make an effort to return empty film spools to the manufacturers. Furthermore, because of the metal shortage, it was necessary, in some cases, to develop substitute materials for packing films that formerly were enclosed in heat-sealed metal foil. Improvements in the domestic packing of sensitized materials, however, obviated the necessity of tropical packing of many photo products. Radioactive particles from nuclear explosions in Nevada early in the year resulted in "hot" snow over many parts of the country which, in turn, caused photographic manufacturers to inspect their raw materials for possible contamination.

Amateur Motion Picture Photography

Motion picture enthusiasts were able to choose from a variety of new equipment. The Brownie Movie Camera was an inexpensive 8mm roll loading camera intended to bring movie making to people who previously could not afford it. The camera was equipped with a 13mm f/2.7

AERIAL PHOTOGRAPHS TAKEN BEFORE INCH'ON, KOREA, INVASION LANDING—LEFT: Vertical of Blue Beach. The sea wall is about 1,775 feet long. RIGHT: Forward oblique of Blue Beach sea wall on August 31, 1950 with tide out. Used to estimate beight of sea wall prior to invasion of September 15, 1950. Credit: U. S. Air Force Photo Reconnaissance Laboratory.

Lumenized Cine-Ektanon Lens; a molded plastic circular disc with Waterhouse type stops in place of an iris diaphragm; and a single shutter (16 frames per second) that also acted as a governor.

The Bell and Howell Company introduced a somewhat more elaborate 8mm roll loading movie camera, the 134-V. Its new viewfinder showed both standard and telephoto lens fields, and an improved exposure calculator was attached to the side of the camera. (Intern. Photographer, 23:21, August 1951).

The German-made Nizo 8mm camera was furnished with either an f/1.9 Schneider or f/1.5 Rodenstock lens. Small and compact, the camera used a unique double lens mount on a slide which shifted up or down for instantly interchanging standard and telephoto lenses with approximate optical compensation in the viewfinder.

The Bell and Howell Model 70 D. L. 16mm motion picture camera featured a new parallax correcting view-finder that is adjustable from three feet to infinity, a 1-inch, f/1.9 Super Comat Lens, seven operating speeds from 8 to 64 frames per second, and a 23 foot film run with an automatic stop.

The Kodak Ektar Converter, 25mm to 15 mm, gave users of the Kodak Cine Ektar Lens, 25mm f/1.4, a wide angle combination with a 40 percent larger field.

Professional Motion Picture Photography

Professional motion picture photographers expressed interest in a 16mm version of the famous German-made Arriflex 35mm Camera that made its initial appearance at the 1951 Cologne Fair and, later in the year, became available in the United States. Weighing only 6½ pounds, the Arriflex 16 has a three-lens turret with divergent optical axes and a reflex mirror viewing system which permits the cameraman to view and focus through the taking lens even with camera running. (Amer. Cinemat, 32:309, August 1951).

The Paris-made 35mm Eclair Camerette, introduced in Hollywood late in 1949, was modified this year for use with both 35mm and 16mm film. The 16/35mm combination model (the Cameflex) permits the one camera to use either film size interchangeably, merely by changing the film magazines and inserting a mask in the film gate.

The new Auricon "Super-1200" 16mm sound-on-film

camera has a 1,200 foot film magazine and a triple finder system consisting of a ground glass focusing reflex finder with a 10X focusing telescope, a studio-type ground glass unit, and a special telephoto type finder which operates with a set of miniature lenses mounted in the center of the three-lens turret. (Amer. Cinematographer, 32:223, June 1951).

The Radio Corporation of America introduced its Model 400 16mm recorder projector. It will reproduce either optical or magnetic sound and was said to be the first instrument permitting the direct recording of a commentary or musical background magnetically on the edge of 16mm motion picture film. (Intern. Photographer, 23:23, Sepember 1951).

In an article entitled "The Laboratory of Today with Tomorrow's Design" [Ideal Kinema (Supp. to Kinematograph Weekly), 17:4, July 5, 1951], R. H. Cricks described the Debrie Multiplex daylight developing machine for large scale processing of motion picture film. This equipment was installed in the London (England) laboratories of Associated British Pathé. The same author in the June 28 issue of the magazine described the "Spray Master" motion picture developing machine recently installed at the M G M British laboratories in London.

"The Practical Use of Latensification" was the title of an article in American Cinematographer (32:54, February 1951) by A. S. C. photographer P. Tannura. In it he described the manner in which he used Columbia Pictures "fifty foot candle" system of low level lighting to make that studio's picture "Harlem Globetrotters".

The processing of motion picture positive film by high temperature developers and fixers, and subsequent drying of the film by turbulent air were discussed in two papers. R. Hodgson and J. Hammer of Paramount Pictures Corporation stated in the first paper (J. Soc. Mot. Pict. Tel. Eng., 56:261, March 1951) that film so processed is superior in some respects to film processed by conventional laboratory methods. L. Katz in the second paper discussed the theoretical and practical aspects of ultrarapid drying of motion picture film by means of turbulent air. (Ibid, 56:264, March 1951).

The adoption of safety base film throughout the motion picture industry has required the abandonment of the standard Bell and Howell perforation for color release prints.

Looking toward the adoption of a single standard perforation for negative and positive films, W. F. Kelly and W. V. Wolfe described tests by the Motion Picture Research Council covering registration problems as well as accelerated and normal release tests on Dubray-Howell perforated black-and-white prints (J. Soc. Mot. Pict. Tel. Eng., 56:30, January 1951). W. G. Hill also discussed the problem of standardization in this field (Ibid, 57:108, August 1951).

The part that motion pictures have played in the work of the United States Department of State in the global war of ideas was described by T. Canning (Mot. Pict. Herald, 184:23, August 25, 1951). The magnitude of the operation was indicated by the 1950 expenditure of

more than 11 million dollars.

Television

The rapid growth of television in the United States made it one of the nation's biggest industries, and in it photography continued to play an ever increasing role. At least 30 percent of all TV programs were on film and some estimates went as high as 50 percent. In 1951 the industry was expected to use 300 to 350 million feet of film, most of which was black-and-white 16mm motion picture film. Some producers, however, were already shooting films in color.

Television stations continued to be interested in older films. A Los Angeles (California) station, KTTV, for example, bought 175 movies, mostly westerns, in one group,

all of which had been made before 1947.

J. Fairbanks described a new development in filming TV shows that is economical of both time and effort. In the Multicam Process three or more cameras are used simultaneously to record a scene from three or more angles or from long, medium, and close-up positions. It permits a picture to be photographed in continuous action. (Internat. Phot., 23:6, February 1951).

Much new equipment was introduced. Besides new cameras and lenses, two new projectors were notable. The Eastman 16mm Television Projector, Model 250, was one, and a continuous projector for film was the other. The latter, developed by the Bell Laboratories, was described in a paper by A. C. Jensen, R. E. Graham, and C. F. Mattke at the October 1951 convention of the Society of Motion Picture and Television Engineers in Hollywood, California.

a picture 18 inches by 10 feet is exposed in the camera. Film reels hold 5,000 feet of film 18 inches wide. Credit: Photograph by United States Air Force.

Stereoscopic Photography

Most new developments in this field concerned motion pictures; however, at least four new still cameras were introduced. The Iloca Stereo Camera was imported from Germany. Fitted with 45mm, f/3.5, coated Ilitar lenses and Prontor-S shutters, the camera was, in general appearance, a conventional miniature camera made into a stereo model. (Amer. Photo., 45:200, April 1951). The Stereo Realist Camera was improved by the use of f/2.8 lenses, and a new model of the Busch Verascope was put on the market. The Viewmaster Stereo Camera was announced that made 37 pairs of photographs on a standard 20 exposure roll of 35mm film.

One high point of the year in sterescopic motion pictures was a demonstration of Cinerama, a new variation of three dimensional movies, invented by F. Waller, of Huntington, New York. Three projectors, each filling one third of a huge curved screen (about three times as wide and twice as high as a conventional movie screen), showed a scene which had been photographed at different angles with a three-lensed camera. The screen was too large for the eye to see clearly all at once, and the images caught by the corner of the eye plus the curve of the screen produced a three-dimensional effect. (Time, 58:94. July 2,

1951).

Color Photography

An improved Ansco Plenacolor film, an amateur color negative film from which color prints can be made, was available in 120 and 620 roll film sizes. (Home Movies, 18:287, August 1951). Kodachrome Professional Sheet Film, on the other hand, was discontinued by the Eastman Kodak Company to make possible a more intense effort towards manufacturing and improving the customer-processed Kodak Ektachrome Sheet Film. A list was published of 60 commercial laboratories in the United States that were equipped to process Ektachrome Film.

As an aid to color photofinishers processing Kodak Ektachrome Film, the manufacturers provided control strips by means of which the processor can check the condition of his solutions and the consistency of his results. From the moment the strips are exposed until they reach the cus-

tomer, the strips are kept frozen.

In August Ansco announced the availability of their Natural Color film in 8 mm and 16mm magazines. (Photo.

Trade News, 15:88, August 1951).

In Hollywood no fewer than six color processes were available or were about to be made available in a field that not long ago was dominated by Technicolor. These included Tri-Art Color, Cinecolor, Supercinecolor, Trucolor, Ansco Color and Technicolor. Twentieth Century Fox's lenticulated color process was said to be still in the development stage. A new company Lenticolor, Ltd. was formed to control the patents of Keller-Dorian and Kislyn in the field of lenticulated film. Licenses were granted to the Eastman Kodak Company and were offered to others.

The firm of Filmeffects, Hollywood, developed a technique for making 35mm release prints on Ansco Color Film Type 732 from 16mm Kodachrome originals. Details and other aspects of the problem were described in paper by Mosser and Dunn. (J. Soc. Mot. Pict. Tel. Eng., 55:635,

December 1950).

Evans and Finkle discussed the problems of making a sound track on Eastman Color Print Film. (Ibid, 57:131,

August 1951).

As the film user rather than the film manufacturer has become directly concerned with processing and printing color films, interest in the sensitometry of color materials and processes has grown throughout the motion picture industry. F. C. Williams discussed the problems of color

sensitometry and indicated that the sensitometric apparatus and techniques now available are adequate for important applications in the manufacture and use of color materials. (J. Soc. Mot. Pict. Tel. Eng., 56:1, January 1951).

Technicolor announced a change in color balance of its three strip system from that of sunlight to a color temperature of about 3350 K. This change followed the earlier announcement of a speed increase in the Technicolor system by a ratio of 450 foot-candles to 300 foot-candles on a sunlight basis. By going to 3350 K, a further speed increase to 150-foot candles was obtained. The emulsion characteristics of the film, the optical system of Technicolor cameras, and the film processing procedure were all revised. (J. Soc. Mot. Pict. Tel. Eng., 56:569, May 1951).

In the foreign field of color motion pictures, G. Monteleoni described the use of Ferranicolor Film in Italian motion picture productions. (Ferrania, 4:16, December 1950). A new British direct negative color process was described by W. Frerk. (Functional Phot., 2:13, March 1951). The method of direct three color development will be used for a motion picture film to be called Alfacolor and for roll film, sheet film, and paper, all to be called Alfachrome.

Two papers concerning Ansco Color Daylight Film and Ansco Printon added to the already considerable knowledge about those products. J. G. Hainsworth discussed the 20-minute process for the Ansco Color Daylight Film and the 16-minute process for Ansco Printon. [PSA Journal, (Phot. Sci. and Tech), 17B: 47, April 1951]. In the second paper K. Schadlich concluded that the resolving power is determined primarily by effects that occur at the instant of exposure. (Ibid, 17B:70, April 1951).

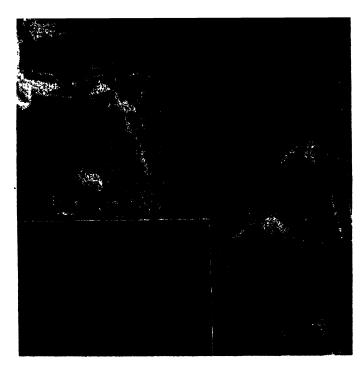

Among the year's most unusual color photographs should be noted the picture in Life Magazine, Volume 31, for July 16, 1951 of an atom bomb being exploded earlier in the year in Nevada; a six page, folded, panoramic spread of a full solar cycle taken at one hour intervals north of the Arctic Circle; and a night flashbulb photograph of Levittown, Long Island, New York, said to be the largest such color photograph ever made.

Military and Aerial Photography

The Korean fighting and the national defense program stimulated many new developments in military and aerial photography. J. Burke and G. Schmesinger outlined the characteristics of a German 3 meter focal length camera and described the design, alignment and testing of a folded 3 meter focal length camera made by the U. S. Army Signal Corps. (Phot. Eng., 2:1, No. 7, 1951).

The basic necessity for making photographic enlargements at sea led to the development of an electronic flash enlarger by the Aeronautical Photographic Experimental Laboratory, Naval Air Material Center. The equipment incorporated a gaseous discharge lamp for its light source, adapters for roll film and sheet film to take negatives from 35mm to 7- by 7-inches, a photocell-controlled lens aperture, and an automatic roll paper easel. The U. S. Signal Corps Engineering Laboratories developed a camera called "Two Minute Minnie" which uses the electrostatic, electrophotographic process called Xerography.

By the use of a standard X-ray machine and Polaroid Film similar to that used in the Polaroid-Land Camera, it was possible to make radiographs in forward battle areas to determine the extent of injuries without evacuating soldiers to hospitals equipped with darkrooms and conventional processing equipment. (Wall Street Journal, March 4, 1951). A new combination aerial combat-reconnaissance camera was announced by Bell and Howell. Designated Type A-6 by the Air Force, it is a lightweight

DEEP SEA CAMERA FOR STUDY OF UNDERWATER EXPLO-SIONS—Explosive charge is located within frame being lowered overboard. Steel sphere at end of frame contains high-speed camera. INSERT: Photograph of underwater explosions made with camera. Credit: U. S. Naval Ordnance Laboratory and Woods-Hole Oceanographic Institution.

portable 35mm motion picture camera of extreme versatility. (Amer. Cinematographer, 32:280, July 1951).

Two spectacular color photographs of bomb damage at Wonsan, Korea, (Life Magazine, 31:6, 17, July 9, 1951) illustrated a limited description of the S-11 electronic aerial strip camera. Component parts include a scanner for determining ground speed, a synchronizer which transforms information from the scanner into altitude, air speed, slit width and exposure information, and a servo power unit that modifies these data for focal length and depression angle of the camera. The camera itself, receiving all this information, drives the film at the correct speed across the slit. This S-11 strip camera was used along with a K-22 (24-inch focal length) aerial camera to determine the heights of the sea-walls at the two invasion beaches at Inch'on, Korea, prior to the invasions. Discrepancies between the pre-invasion (aerial) measurements and the post-invasion (ground) measurements averaged only about six inches. (Photogram. Eng., 17:78, March 1951). Vital battle time was saved by radioing back aerial photographs taken by the Land process of enemy territory to show battle positions and strength. The method is much the same as that by which news photos now are transmitted within this country. The transmitted pictures having 150 lines per inch could be sent about 100 miles (Sci. News Letter 59:54, Jan. 27, 1951).

Among the new developments in Naval photography reported by Captain J. H. McElroy were the XCA-11, a continuous-strip camera; the SCA-12, a single-frame, imagemotion compensation camera; processing and printing equipment for the 70mm film used in the XCA-11 and XCA,12 cameras; a deep-sea, underwater camera Type XCPX; the Mark 4 Submarine Periscope Camera; an electronic flash enlarger; and the CA-8 Cartographic Camera. [PSA Journal (Phot. Sci. and Tech.), 17B:6, February 1951].

SHOCK WAVE STUDIES WITH SU-PERSONIC WIND TUNNELS - TOP: General view of tunnel showing schlieren camera in foreground. wing plane model can be seen through the glass porthole to the left. To the right of the test sec-tion is machinery which operates the flexible nozzles, by which air speeds above the speed of sound are varied. ROT-TOM: Shock wave photographs of an experimental model at superand bypersonic speeds. Top view shows model at air speed 2.8 times the speed of sound; middle view, at 4.6 times speed of sound; lower view, at 6.3 times the speed of sound, well into bypersonic range (rough-

ly equivalent to 2100, 3500 and 4900 miles per bour at sea level temperatures). Credit: National Advisory Committee for Aeronautics, Ames Aeronautical Laboratory, Mosfett Field, Calif.

At the Naval Ordnance Test Station, Inyokern, China Lake, California, a new continuous processing machine for film 70mm to 12 inches wide was developed, utilizing the principles of motion picture film processing. H. Hewston and C. Elmer described the details of design and operation of the machine. (J. Soc. Mot. Pict. Tel. Eng., 56:613, June 1951).

A huge aerial reconnaissance camera was shown in March 1951 by the Perkin-Elmer Corporation. The modified strip camera was eight feet high, weighed about 1,500 pounds, and had a focal length of 48 inches. The field of the camera covered a continuous strip of territory 100 miles wide from an altitude of 40,000 feet. The spool, loaded by terman Kodak Company, held 5,000 feet of film, enough to photograph the entire state of Pennsylvania from 40,000 feet in less than one day. (Time, 57:54, March 12, 1951).

P. Carman and R. Carruthers discussed methods of minimizing the effect of aircraft vibration on the quality of air photographs and described an improved method of testing aerial camera mounts as well as an experimental mount having unusually good vibration elimination characteristics. (J. Opt. Soc. Amer., 41:311, May 1951).

An experimental study of the photography from the

An experimental study of the photography from the ground of objects in the upper atmosphere showed that the results were improved by the use of long focal-length lenses, high contrast film, and color filters chosen with regard to the elative spectral qualities of the object and

the sky background. In the report of this investigation, C. Nelson and D. Hamsher described a high contrast, high speed panchromatic film especially designed for the work and gave exposure and processing data for it. (J. Opt. Soc., Amer., 40:863, December 1950).

Underwater Photography

A. Schoeni described the history of the U. S. Navy's interest in underwater photography and reviewed the equipment, up to and including the currently used French-made Aquaflex Camera. (Camera Mag., 74:90, June 1951). J. Hahn reported on some of the problems encountered in deep sea underwater photography, and biologist J. F. Storr wrote a detailed account of his personal experiences and the equipment he developed for photographing marine life in the Bahama Islands. (Intern. Photographer, 23:10, July 1951).

The U. S. Naval Ordnance Laboratory and the Woods Hole (Mass.) Oceanographic Institution jointly performed an elaborate experiment to observe the expansion and contraction of explosion bubbles taken at depths as great as two miles. Three cameras were used: a 35mm Fastex, Eastman High Speed, and a modified Bowen rotating mirror frame camera. The letter camera, used for making studies at the greatest depths, made a series of 100 pictures at the rate of from 20,000 to 30,000 frames per second. (Amer. Cinematographer, 32:48, February 1951).

High-Speed Photography

H. Edgerton and W. Wyckoff described the Rapatronic high-speed still-exposure camera. The shutter is of the magneto-optic "light valve" type operating by the rotating of the plane of polarization of light traversing glass in a magnetic field. It has at least a 30-degree viewing angle, and takes pictures of 2 to 20 micro seconds with a high degree of resolution. (J. Soc. Mot. Pict. Tel. Eng., 56:398, April 1951).

The hypersonic research facilities at the Ames Aeronautical Laboratory, Moffet Field, California, include a 10- by 14-inch supersonic wind tunnel and a supersonic free flight wind tunnel. V. Stevens of the National Advisory Committee for Aeronautics described these tunnels and their associated equipment and outlined the techniques by which measurements are made at speeds of Mach numbers of 3.5 to about 8. (J. Appl. Physics, 21:1150, November 1950). I. D. V. Faro, T. R. Small and F. K. Hill of Johns Hopkins University described tests designed to produce supersonic streams at ten and sixteen times the speed of sound. (J. Appl. Physics, 22:220, February 1951).

Photogrammetry

The major part played by photogrammetry in highway location surveys was described by J. S. Beazley (Photogrammetric Eng., 17:571, September 1951). At the seventeenth annual meeting of the American Society of Photogrammetry, held in Washington, D. C., January 10-12, 1951, there was held a panel discussion of cameras, lenses and calibration, moderated by L. E. Howlett. Differences of opinion existed, of course, but progress towards standardization was very evident. (Photogram. Eng., 17:391, June 1951).

In the field of new equipment, R. Prickett and M. Morris described the orthogonal photographic scanning camera, known as the Orthocamera, originally invented by H. L. Cooke. By completely eliminating perspective, the Orthocamera takes pictures or orthographs that combine the geometrical characteristics of the best mechanical drawing and the familiar, easily interpreted, pictorial effects of ordinary photographs. (Ibid, 16:823, December 1950).

An electrically-tripped 35mm camera for airborne mapping and charting applications was developed by Cook Research Laboratories. Capable of taking pictures at the rate of four frames per second, the camera had an electronic flash illuminating system with a discharge duration of about 10 microseconds. A switch located on the camera shutter triggered the flash at the instant of maximum shutter opening. (Mach. Design, 23:136, February 1951).

The Fairchild Precision Camera Calibrator, announced in September, 1950, is a modification of the very exacting Precision Camera Calibrator designed at the National Bureau of Standards. The device provides means of testing the resolution of lenses up to 12 inches in focal length and having entrance pupils equal to or less than 1.45 minutes in diameter. The solution of problems arising from the inclusion of resolution test conditions in equipment designed initially for distortion testing was described by Mrs. C. Norton. (Photogram. Eng., 16:688, December 1950).

A photographic printing and processing machine, developed for mass production of reconnaissance photography but suitable for printing photographic material used as a basis for charts and maps was described by G. T. McNeil. (Ibid. 17:484, June 1951).

The Photographic Process

A new method of photographic processing that eliminates the necessity for washing films and prints was developed by the U. S. Army Signal Corps. Known as stabilization processing, the new method permits processing times ten times faster for film and twice as fast for prints. Briefly, the process consists of development in a special amidol developer, rinse in stop bath, followed by treatment in a stabilizer solution. (Phot. Eng. 2: No. 3, 148, 1951).

An extensive research investigation on coupler compounds used in emulsion and developers for color materials was reported in a comprehensive paper entitled "The Chemical Constitution, Electro-chemical, Photographic and Allergenic Properties of p-Amino-N-Dialkylanalines" by R. L. Bent and twelve other scientists (J. Amer. Chem. Soc., 73:3100, 1951).

The action of developers as tanning agents was described by R. B. Pontius [PSA Journal (Phot. Sci. and Tech.), 17B:76, September 1951]. R. W. Henn discussed the qualitative determination of metallic (cationic) and anionic constituents of photographic scums and sludges. (Ibid, 17B:60, April 1951). The activity of sodium sulfite in fixing baths was the subject of a paper by E. Gruenthal. (Ibid, 17B:90, September, 1951).

R. W. Henn and J. I. Crabtree described the action and optimum operating condition for an acetic acid stop bath and made specific recommendations for replenishing Kodak Stop Bath SB-5a, a photofinishing formula. [PSA Journal (Phot. Sci. and Tech.), 17B:13, February 1951].

For the photofinisher, F. J. Cowan and R. L. Huber wrote a review of practical methods of film processing control. (Photo Developments, 26:30, February 1951). The Eastman Kodak Company introduced a new stop bath and a new fixing bath, known as Kodak Stop-O-Mat and Kodak Fix-O-Mat, for use on its Continuous Paper Processors.

A symposium on photoprocessing consisting of 14 papers on various subjects was held at Asbury Park, New Jersey, under the joint sponsorship of the Signal Corps Engineering Laboratories and the Society of Photographic Engineers (Phot. Engineering, 2.87,209, 1951)

(Phot. Engineering, 2:87-209, 1951).
in a paper entitled "Formation of the Latent Image by X-Rays" [PSA Journal (Phot. Sci. and Tech.), 17B:19, February 1951], E. T. Larson reviewed the similarity between the effects of x-rays and visible radiation on silver

halide emulsions and noted that the addition of small amounts of gold compounds may increase the X-ray sensitivity of an emulsion by as much as ten times.

The problem of water supply in darkrooms was discussed by H. F. Walton (Amer. Phot., 45:341, June 1951) who described the use of an ion exchange process for water softening, and by D. Hanney and D. M. Waldron who described temperature control equipment. (Phot. J., 91B:88, July-August 1951).

F. H. Perrin and J. H. Altman described the resolving power camera in the Kodak Research Laboratories. (J. Opt. Soc. Amer., 41:265, April 1951). L. A. Jones and G. C. Higgins in Parts V, VI, and VII of their series of papers on photographic granularity and graininess (Part V: J. Opt. Soc. Amer., 41:41, January 1951; Part VI: Ibid., 41:64, February 1951; Part VII: Ibid., 41:192, March 1951) described the operation and performance of a variable-magnification instrument for measuring graininess and a microphotometer for the measurement of granularity.

A method of determining the contrast of a photographic paper was proposed by G. Ehrenfried. [PSA Journal (Phot. Sci. and Tech.), 17B:83, September 1951]. L. E. Varden (J. Soc. Mot. Pict. Tel. Eng., 56:197, February 1951) described a semiautomatic color analyzer for determining rapidly the extent of unbalance of a processed color negative or color positive monopack film.

Documentary and Industrial Photography

Microfilm is an important means of spreading information so important, for example, that the United Nations Educational, Scientific and Cultural Organization conducted a world-wide survey of the uses, practices and equipment in various countries of the world.

Microfilm continued to be one of the best means of preserving vital documents against the ravages of fire, flood, and war. The Ford Motor Company, for example, during the last two years microfilmed more than 1,250,000 of its vital designs and engineering drawings and planned to process at least 3 million more. The New York City Public Library embarked on a project of microfilming 8 million cards of its public catalogue over a period of ten months, following which 4½ million cards of the official catalogue will be processed.

A selector used by the Library of the United States Department of Agriculture could scan about 70,000 index entries per minute. Using coded indexes for each abstract, the selector picks out items of information pertaining to a single index entry and makes photographic copies on an auxiliary reel of film which is then processed in the normal manner. (Ind. Eng. Chem., 42:1460, August 1950).

A new Swedish copying camera was introduced that uses perforated 35mm film. With the aid of a variable masking device, single lines or illustrations can be copied. (Tidskr. för Dokumentation, 6:8, No. 1, 1950). A new method of making microfilm copies of radiographs using a negative-positive duplicating technique and a machine designed specifically for the purpose was announced by the Eastman Kodak Company.

Three other copying methods were of interest. The Haloid Xerox Copier, Model A, was used with the Xerox Model XEA-1 (projection) Printer equipped with a Wollensak wide-angle lens at Wright-Patterson Air Force Base to make large projection prints from microfilm negatives. (Pop. Phot., 28:120, June 1951). Xerography was also used to produce in less than one minute a paper master plate of any office form, letter, or drawing which can then be duplicated by a Multilith Process Duplicator. The third new process, the Agfa Copyrapid Process, was an

application of the diffusion-transfer system used in the Gevaert Diaversal, Polaroid-Land, and similar systems.

[Camera (Luzern), 29:376, December 1950]

The Paragon-Revolute M4 Blueprint Machine was described, as used by General Motors Corporation, Ford Motor Company, and the U. S. Army Engineering Corps, for processing Kodak Autopositive and other papers. Kodak Repro-Negative Paper, similar to Autopositive Paper, was introduced along with Autopositive Translucent Paper, which was said to have the advantage of faster print back speed.

Some interesting applications of photography were made known during the year. The Automotive Liability Reduction Association introduced a new service for use by truck fleet owners. It included a kit with camera, filash attachments, and record forms. Film development and negative filing is provided by the Association. (Amer. Phot., 45:239,

April 1951).

The Cuban legislature passed a law requiring photographic identification of all qualified voters. M. R. Kondolf of Webster, New York, invented a camera for police use that photographs moving automobiles, and records the speed at which they were travelling. The production of industrial identification photographs was speeded up by the introduction of the Fairchild-Polaroid Identification Camera.

An entire new wing of Eastman House in Rochester, New York, was opened in May. Known as Brackett Clark Hall, it is devoted to the subject of photographic manu-

Scientific Photography

A massive telescopic camera especially designed for photographing meteors was installed in Harvard University's meteor station in New Mexico. The optical system covered a 52 degree field, or one-tenth the area of the

visible sky. (Time, 57:82, June 4, 1951).

"The Geomorphology and Photo-Geological Study of the Flat Lands" by F. Melton and "Photo-Interpretation of Coral Reefs" by C. Teichert and R. Fairbridge, were two of the papers included in a Symposium on Information Relative to Uses of Aerial Photographs by Geologists. (Photogram. Eng., 16:721, December 1950). Because there are only thirty basic land patterns in the world, any area which can be photographed from the air can be interpreted by geologists. These interpretations can have extremely practical implications; for example, by means of aerial photographs, uranium, diamond and gold deposits have been detected, water reserves can be located, and the progress of erosion can be predicted. (Life Magazine, 30:105, June 25, 1951).

Macromolecules, thought to be the largest of all molecules, were photographed with the aid of "metal shadowing" and the electron microscope. The technique, developed by R. W. G. Wycoff of the National Institute of Health and C. E. Hall and J. Gross of Massachusetts Institute of Technology, showed in three dimensional form the shapes and surface contours of such substances as the tobacco mosaic virus, plant necrosis virus, influenza virus, hemp globulin and frog muscle. (Life, 30:72, April 23,

J. A. Chambers described a temporal sequence camera whose function is to provide a continuous, non-intermittant record of phenomena or of objects in sustained accelerated or decelerated motion, including a simultaneous, accurate, and continuous recording of the time factors involved. (Phot. Eng., 2:53, No. 2, 1951).

In a course of study for selected workers, given at the Institute of Nuclear Studies at Oak Ridge, Tennessee, in July 1951, much attention was given to stripping film techniques for auto-radiography. One technique in particular, developed at Kodak Limited, in England, has been used successfully by S. R. Pelc in the study of chromosomes, The method is said to give resolutions of the order of one micron, and is described in an article by R. H. Herz of Kodak, Limited. (Nucleonics, 9:24, September 1951).

A report describing several methods of photographic determination of the presence of uranium-bearing minerals in rocks and ores was written by L. R. Stieff and T. W. Stern of the U. S. Geological Survey for the Atomic Energy Commission. (J. Franklin Inst., 251:567, May 1951). H. Yagoda of the U. S. Public Health Service described special nuclear emulsions which he used to identify and estimate micro quantities of heavy metals that decay by alpha particle emission. (Chem. Eng. News, 29:1005, March 12, 1951).

A new Ilford, Ltd. electron-sensitive emulsion, G5, especially valuable for cosmic ray work, was made available in thickness up to 600 microns. A. D. Dainton, A. R. Gattiker, and O. W. Lock determined that a p-diaminophenol developer gives satisfactory results for such thick photographic emulsions and described suitable processing conditions for them. (Phil. Mag., 42:396, April 1951).

A semiautomatic device for analyzing events in nuclear emulsions was developed by M. Blau, R. Rudin and S. Lindenbaur. (Rev. Sci. Instr., 21:978, December 1950). Another was described by A. V. Masket and L. B. Williams. (Ibid., 22:113, February 1951). The basic unit of the former microscope is a motor-driven stage; the latter, similarly, has a motorized scanner attached to the stage of the microscope. The instruments promise certain relief from the tedious work of scanning nuclear plates.

Bibliography

The first issue of the official publication of the Photographers Association of America, The National Photographer, appeared in June 1950. The first issue of a German publication, Photo-Technik und-Wirtschaft, appeared in November 1950. This magazine had been published since July 1947 under the name, Foto-Kino-Technik. The technical publication, Kino-Technik, (Radio-Foto-Kinotechnik SMBH, Berlin) resumed publication after a lapse of several years as a result of the war.

A list of new books included:

Adams, A., My Camera in the National Parks, Houghton Mif-

flin Co., Boston.
Berg, W. F., Exposure (The Fundamentals of Camera Technique), Focal Press, London.
Bond, F., Making Better Color Slides, Parts I and II, Camera

Craft Publishing Co., San Francisco.
Chamberlain, K., An Introduction to the Science of Photography,

Macmillan Co., New York.
Chesterman, W. D., The Photographic Study of Rapid Events,

Oxford University Press, London.

Clerc, L. P., Properties of Photographic Materials, translated from French by C. J. Duncan, Fountain Press, London.

Kingslake, R., Lenses in Photography, Garden City Books, New

Nibbelink, D. D., The Complete Book of Lighting for Color and Black-and-White Photography, Midland Publishing Co., Forest Park, III.

Spencer, D. A., editor-in-chief, Progress in Photography 1940-1950, Focal Press, London.

Spottiswoode, R., Film and Its Techniques, University of California Press, Berkeley, California.

Abridged Scientific Publications from the Kodak Research Laboratories, Vol. XXXI, 1949, Eastman Kodak Co., Rochester, N. Y.

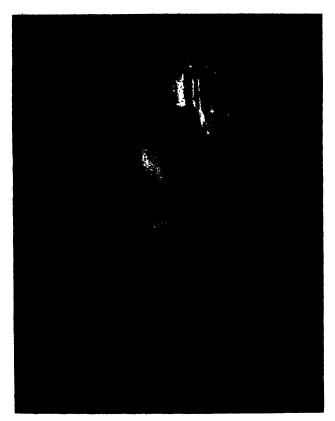

Veroffenslichungen der wissenschaftlichen Photo-Laboratorien der photographischen Abteilung Agfa. Vol. VII. 1945-1948., S. Hirzel, Leipzig.

BOAT DECK PATROL

HARRY L. WADDLE, APSA

A Special Feature On PICTORIAL PHOTOGRAPHY

AFTER THE SWIM

As THE many hundreds of PSA'ers who know her will verify, our mutual friend, Doris Martha Weber, APSA, has an inborn knack for rounding up the writings of the photographic great, or available, for inclusion in PSA JOURNAL. The many, informal, little jam sessions that invariably occur when we of the common hobby congregate, are her happy hunting grounds, and she bee" on many, to swell the interest in some forthcoming

At the Detroit Convention she really reached way back into the North Woods and recruited yours truly for the cause. Well, I begged off at once, on the very good grounds that I really didn't have anything to write about. Living so far away from the centers of photographic endeavor, one is largely influenced by the many books, magazines and periodicals which come around and which are available to all. Apart from the visits to rather distant camera clubs, when the opportunities present themselves, most Canadians, in common with many of our "friendly neighbors," learn from the printed page. By so doing, they accumulate a little knowledge about an awful lot that is photography, but may never acquire sufficient "know how" in any one branch to write about. "In short, I just don't specialize in anything," I told her.

Well, again, you know Doris may have anticipated the answer. "All right," she said, "just write an article on you don't have to specialize to win salon success."

She had me!

For a week or so I gave the idea a lot of thought, and gradually my whole outlook on photographic specialists began to change. Sitting in on the odd judging, and following salon affairs for some time, had created a false sense of admiration for the works of these few, who, having achieved success with some special subject, process or treatment, proceeded to turn out multitudinous prints

You Don't Have

ARTICLE AND ILLUSTRATIONS BY

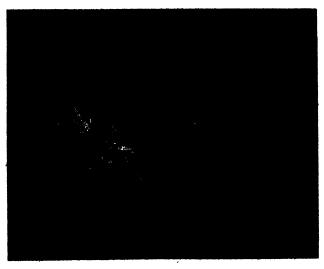

of the same theme, so little varied from the original that the salon committees well imagined that the makers were guilty of changing titles and resubmitting the same copies year after year. I had, all this time, revered the experts who could turn out the flawless technique, or the weird effect, put imagination on paper, or handle their particular subject matter. You have all seen the procession of nearduplicates to which I refer, and no doubt have marvelled and admired and longed someday to be able to specialize in a similar way.

Yet, as I was carried back in thought on the subject, it became more and more clear that subconsciously this admiration for the specialist had been insincere, and with a mouthful of "sour grapes" to add incentive, it could well be imagined that these people indeed were "in a rut." Then a terrible thought struck home! Did people have

me typed?

I recalled that once or twice I had been introduced as Harry "Blimp Man" Waddle, and it might well be that such was the picture conjured up when my name was mentioned. The truth would dispel this supposition completely. The happy circumstance of the man at the focal point of all the converging lines was discovered while driving through Florida. Owing to the known restrictions on photographs in such areas, considerable time was spent in casual conversation with the attendant, then three exposures were made in rapid succession, followed by a hasty retreat. "Blimp Man" has hung over 90 times to date but I have never made a print of the other two negatives or desired to try the subject again. There are, no doubt, many variations in the way the one negative could have been treated, and with a quick change of title and a tilt of the easel, it might have been possible to flood the salons over again. I'm not going to try!

I have always held to the conviction that if your camera

LILY NECTAR

To Specialize

HARRY L. WADDLE, APSA, ARPS

is simple and easy to operate, you stand a much greater chance of capturing the fleeting picture. This was borne out quite vividly during the 1949 PSA Convention at St. Louis. A friend and I were able, by missing our dinner, to visit the beautiful Shaw Gardens. We discovered the lovely lily there, but seconds later it was raining and we ran for cover. Only one negative had been exposed and it happened to be mine. "Lily Nectar" has hung over 75 times. The very few rejections were attributed to the fact that the subject matter is trite. That is quite true, but some of the nice things I have heard concerning the picture have been ample repayment for the disappointments of a few rejections.

Mood pictures have universal appeal, but after initial success of 80 acceptances with "Homeward" in low key, I felt I was justified in trying "Two Fishermen" in a lighter treatment of the same basic ingredients, but in the horizontal format. Both were taken on foggy days, but it was a lot of fun changing the mood so drastically in the darkroom. No variations of either of these have been tried. Perhaps I am too lazy or too easily pleased, but at least

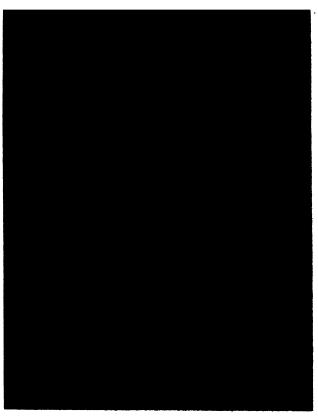

I am not going to specialize here.

The setup for "Boat Deck Patrol" was repeated many times as the sailor made his rounds of the deck, keeping such as me out of danger as the ship pitched through a storm at sea. Needless to say, several negatives were made, all of which were presentable, but it is not likely you will have to grin and bear a very similar variation of this picture next time you visit your favorite salon. If you do, somebody has copied the idea which I did not consciously copy from somebody else.

Two daughters create a formidable argument for "cute kid" shots. "After The Swim" is about the only one you have been bothered with from this source. The original idea centered around a lovely little lady possessing a fine

TWO FISHERMEN

HOMEWARD

pair of pigtails. Unfortunately, she became frightened by the bad man behind the tripod, and our own daughter had to substitute, for the time, to set an example. It was always hoped to be able to remake this picture as it should have been, but the moment the picture "clicked" with the first jury it was too late, in my estimation, to bring on an improved imitation.

At this point there is bound to be some busybody at the back of the room yell, "What about your prints 'The Barn No. 1', 'The Barn No. 2', and 'The Barn No. 3'?" At the time the original was submitted for camera club competition, there was considerable friendly discussion on the merits, or otherwise, of the hydro poles, whether or not there had been misplaced emphasis, etc., and three different prints were made deliberately from the same negative, and sent out simultaneously, for jury reaction. A careful card index has been kept of the wanderings of these prints, and if a show has been kind enough to give any one of "The Barn" series wall space, it will not be embarrassed next year with another. I believe this is a legitimate procedure when we from the out-of-the-way places wonder seriously about the merits of similar pictures, but a word of caution not to use it to extreme, may be in order.

Tabletops, flower studies, close-ups, nudes, abstracts, snow scenes, animals, seascapes, portraits; I hope you have tried them all, too, and have been successful with most. Chances are, you see, if you have done so, you have not had time to specialize in any one. Maybe you, too, are jack of all photographic subjects and master of none. One thing is quite certain, you have had a lot of fun trying, and you have built up a collection of prints from which every lover of beautiful things can find inspiration.

No, you don't have to specialize, unless you want to

specialize in not becoming a specialist!

SHIBBOLETHS and SUCH

SEWELL PEASLEE WRIGHT, APSA

would like to disagree with a number of the experts; some of them genuine experts, some of them self-constituted experts, like myself.

Before anyone challenges my position as an authority, let him read again the sentence immediately above.

A vast amount of criticism has been levelled at presentday salons, including, even, criticism of the designation itself. You may substitute "exhibition" for "salon" in reading this, if you prefer; I use "salon" because that designation is in more general use, and may be more readily understood by the great unwashed.

Perhaps I am naive, but I like the salons as they are. I admire them. I think they have done, and are doing,

a good job. If that be treason . . .

Having done a bit of judging myself, and having attended a goodly number of judgings, I have had the privilege, over the years, of associating with many of the men and women who decide the fates of your four, and mine. In my opinion, the vast majority of judges are learned, competent, expert, and conscientious men and women.

Fallible? Yes! It's very easy to make mistakes when a thousand prints, more or less, pass through the lightbox or across the easel—most of them twice, and many of them three times. I've helped hang a few bad prints, and I've had some bad prints hung. I've helped kick out some good prints—at least, prints that had good salon records. And, of course, I've had good prints of my own wind up in the OUT pile. Working at the speed at which salon judges must work, these things are inevitable.

Inevitable, too, is the development of shibboleths, and that's what I really want to talk about: shibboleths.

You remember the Biblical story. The Ephraimites were fleeing from Jephthah and the Gileadites. Jephthah was a smart man. He knew that the Ephraimites could not pronounce the sound sh, so Jephthah set guards at the ford of the river Jordan and demanded that all who would pass over must first pronounce the word shibboleth (meaning "a stream in flood") and which the poor Ephraimites pronounced "sibboleth", with the result that they were all thus identified and caught.

I realize, I know from experience, that salon judges tend to develop a series of shibboleths to help them make the quick decisions which must be made.

My premise is that it is not good practice to set up and use such shibboleths, by which prints are automatically rejected.

Just to be sure everything is tidy and shipshape before we proceed, here's the formal definition of shibboleth: "A test-word or pet phrase . . . a watchword."

Some of these shibboleths stem from personal prejudices, some from a too-easy and too-general interpretation of rules the judges have heard or read or have worked out for themselves. They are dangerous things because they are set rules and, as someone has said, there are exceptions to ALL rules, including this one!

Let's examine some of these shibboleths. One of the most common, perhaps, is that pure black backgrounds are OUT.

Now, that's a shibboleth which is understandable, to a degree. Pure black backgrounds do not "exploit the the medium." They're uninteresting. There should always be detail in the shadows. Artists (sic!) do not use pure black backgrounds. (I challenge this flat statement, although I cannot back up my challenge with concrete proof. I have a strong hunch that very competent artists in other media have, and more than once, used pure black backgrounds to create a definite and pre-determined effect. But they are not commonplace, perhaps, so we mustn't have them in photography!) The judges have never made prints with pure black backgrounds, they don't like prints with pure black backgrounds, they've never seen such prints hung, and therefore, all prints with pure black backgrounds are OUT!

This, I submit, isn't reasonable. Maybe black backgrounds, usually, are bad. Maybe black backgrounds should usually be avoided. Maybe you happen not to like them. But suppose I vote "out" on a print and am asked why, and I reply simply: "It has a black background!" Is that a fair answer? I think not; I think I have used a shibboleth, a "testword." I have said, in effect, that all prints with pure black backgrounds—and that is neither a reasonable nor an artistic position.

I can conceive of artistic creations which might demand a pure black background, just as reasonably as a true high-key picture demands a pure white background. I think that were I a judge tossing out a print with a pure black background, I should be in a position to explain that my action was based on the sincere belief that a black background was not artistically valid in the case of that particular picture.

There's another shibboleth I have heard used both by judges of international salons and by camera club print critics, to the effect that the square format is unlovely and inartistic.

Again I am forced to disagree. There are pictures that should be exactly as wide as they are high. They gain by this cropping. I admit that the vast majority of pictures are inartistic when presented as perfect squares, but to be prejudiced against a print simply and solely because it is a square print is not, in my opinion, an intelligent attitude. Again, the better judge would explain "I believe the

square format is not suitable to that subject matter"--not "It's out because it's square!"

The business of toning spawns a whole school of shib-

boleths.

Multiple-toned prints are OUT simply and solely because they are multiple-toned. Personally, I do not like multipletoned prints, as a general rule, but I have seen a few that I thought justified the technique.

All snow pictures should be blue-toned. Well, it's true that in the opinion of most people, most snow pictures are improved by bluetoning. But I can recall a number of snow pictures which, for perfectly sound, artistic reasons, seemed to be more effective in plain black and white.

Green-toned pictures are impossible. Still, one of the most charming prints I've ever seen was a green-toned shot of some sort of wildflower, and some of the most delightful bromoils I've seen have been done in lovely shades of green. And I recall a number of delightful, green multiple gums, too. I realize that the bromoil and multiple gum processes do not involve toning per se, so let's not argue about that.

But the biggest producer of shibboleths, perhaps, is our old and familiar friend, composition.

"Everything is square-dab in the center. Out!" Well, that's a very common shibboleth, which appears to be based upon the well known rules of composition, but actually is not. There's a good deal of picture material that is most effectively presented "square in the center."

"There's no center of interest. OUT!" Wait a minute, judge! If you'll think back over the shows you've hung, and seen hanging, you'll recall just a whole lot of pictures that were mighty good pictures, yet had no vaunted center of interest. How about the over-all pattern shots, for example? The "center of interest" is the whole picture; the rest of the composition is its surroundings: the mount, the wall on which it hangs. The eye isn't invited to travel a certain path in the picture, and rest with a sigh of delighted satisfaction upon a certain thing; the whole picture is a center of interest.

And speaking of centers of interest, we mustn't overlook another very popular shibboleth:

"If only someone were coming up that empty path, I'd take it. As it is—OUT!"

Oh, boy! There's one that gets in more hair than, perhaps, any other. There must be somebody in the path or the road or the doorway, or else. Not only that, but these shibbolethers even have definite ideas as to which way the person should be heading. Some insist the person must be going down the road, back to the camera; others are just as sure the person must be coming toward, and facing, the camera. Otherwise—OUT!

Granted that many unpeopled scenes would be improved by the addition of a human figure, I beg to argue that many other scenes would be (and often are!) ruined artistically by simply sticking in a figure because some judges insist on figures. Circumstances alter cases; I plead for a verdict on any picture based on the artistic effect of that particular path, or doorway. "Must" is a pretty strong word, friend!

Head-only portraits of pets, particularly if the head is presented larger than life size, are sometimes regarded as automatic outs. It may well be that it's usually better to show the whole dog, or the whole cat, but I've seen many a head-only portrait of a pet that I thought was worthy

of a place on the wall of any salon. The stern ruling that you must always show a cat being a cat, and doing a cat-like thing, is a shibboleth with which I can't agree. I can't even agree that all larger-than-life pictures are automatic outs, either; they should go out often, perhaps most of the time, but not ALL the time merely because they are larger than life.

It would be possible to go on for many, many pages, listing the shibboleths, and pointing out their fallaciousness, but neither you nor I have the time for all that. It might be interesting, though, for you to keep your ears tuned for shibboleths, and make a list of your own—whether you be judge or simply one who sends his four to this salon and that.

I said at the outset that I like and admire the salons as they are. I have read and heard the criticisms levelled at them, and I have even seen a few aggregations of prints made by those high vocal ones who would lead us out of the wilderness in which we are lost. I was not impressed by those displays, nor were the majority of others who saw them—and I refer to photographers and the general public, alike.

This discussion on shibboleths is not intended as an adverse criticism of salons, nor of the men and women who judge them. I feel about the salons much as I feel about my country, and I think that the United States of America has made a lot of mistakes, will make more, is not perfect, has forgotten many important principles, has tried a lot of freakish panaceas, rushes in where angels fear to tread sometimes and hesitates much too long at other times, is too tough today and too sissy tomorrow, is not by any means what the founding fathers had in mind, nor is wholly what I would like my country to be—but I still wouldn't swap my right to call myself an American for any consideration my mind can conceive.

Sure, I have been carping about shibboleths. I have done so because I hope that by giving them a name, by bringing a few of them out into the open and examining them, we may eliminate them—or if not wholly eliminate them, at least help reduce their use.

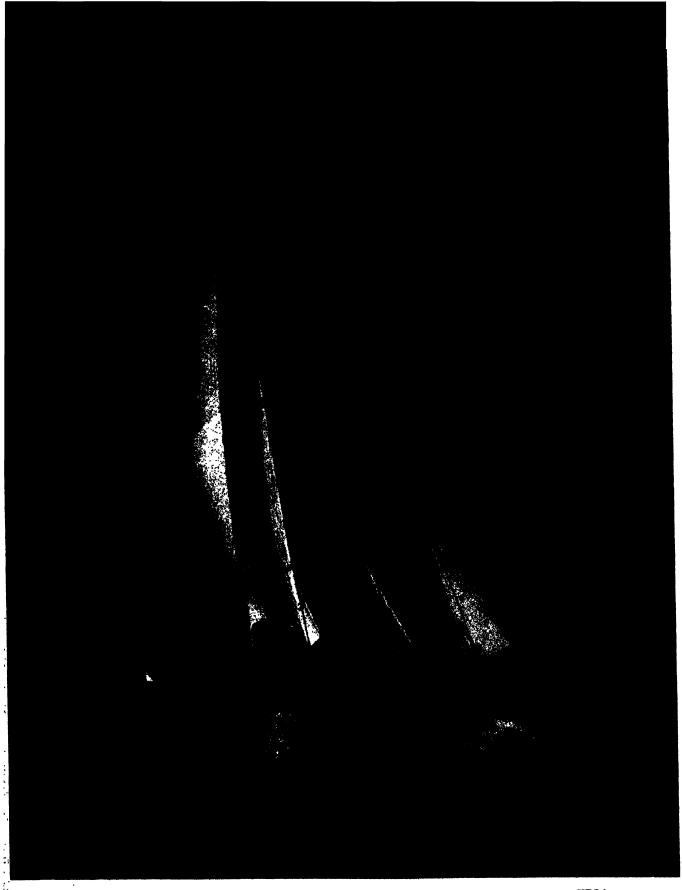

It is reasonable, I believe, to assume that if we eliminate shibboleths, we shall automatically encourage those who quite naturally want their pictures to hang, but are still desirous of making pictures they feel to be artistically valid, yet which today would fall, too often, under the black shadow of existing shibboleths. If we are hanging the same old stuff, year after year, as we are accused of doing by our critics, the reason may be our shibboleths!

We must have standards by which to judge pictures, and by which pictures are judged, but they should be true artistic standards, which are never rigid, inflexible, and inviolable. The shibboleth, by definition is rigid, inflexible, and inviolable.

As judges, the shibboleth makes our job easy—too easy! As print-makers, the knowledge that shibboleths will be used against us tends to keep our feet in well-worn paths, and to inhibit us against interesting and sometimes artistically profitable explorations.

I am quite convinced that if we can eliminate the shibboleth in judging pictorial photography, we shall hang more diversified shows, more interesting shows, and more artistic shows, at the same time remaining within the bounds of the present general concept of pictorial photography.

What say we give it a whirl?

KNIFING THROUGH THE WAVES

J. ELWOOD ARMSTRONG, FPSA

Action is dramatically portrayed by the bull of the boat kicking up a splash on both sides. The angle of view presents an interesting pattern of the white sails against a dark blue sky.

Marine Pictorialism

J. ELWOOD ARMSTRONG, FPSA

ARTISTS, for many years, have devoted their time to dramatizing the many facets of the sea. Down through the ages men have built many types of craft, from the Viking ships of old to the modern sailing vessels and power driven boats. At first, the boats were built to permit men to explore unknown expanses of the sea, and, as time progressed, the ships served the purpose of transporting people and cargoes to distant shores. Today, boats include not only those designed for exploration and transportation, but a wide variety built for pleasure purposes as well.

Man's conquest of the sea, through the development of many types of craft over the years, has ever been a source of great interest to people in all walks of life. A few years ago, a comprehensive study was made by Cecil B. Atwater, FPSA, of subject matter and its appeal to art students, camera club members and the general public. The result showed that out of fourteen different categories of subject material, marine studies were second on the list as to interest and appeal, and were surpassed only by winter scenes.

This shows that marine studies are inherently interesting, and can prove to be a continuous source of many pictorial presentations. These studies can be made in prints in monochrome or color, and the suggestions herein can be applied to color slides as well. Fundamentally, the making of successful marines is a matter of subject selection, viewpoint, compositional arrangement and technique. However, the picturization of boats, lighthouses and moods of the sea is not without certain difficulties that present a definite challenge. Some of these problems will be discussed later in this article.

All of us have the opportunity, at one time or another, to focus our camera on one of the most exciting subjects the workaday world offers—boats! Perhaps they'll be lake freighters, tankers, ferryboats, workboats, tugs, barges, rowboats, canoes or sailboats. Sometime we may have the good fortune to catch a majestic passenger liner from an interesting angle. But the fact remains, when you see a boat, the chances are good that there's a way to catch plenty of adventure in the click of a shutter.

Small boats can be photographed in coves, along rivers and streams, and, if properly framed, may be used to convey a feeling of peace and quiet repose. At the regattas the racing boats thrill the crowd, and, if you capture good action pictures of such events, they can give you an exhilarating feeling of dramatic movement. Along our many navigable rivers there are tugs, ferryboats and barges. Even the old paddle-wheelers are still in use in many places.

These interesting boats not only affect our everyday lives, but provide opportunity for good pictures. Large freighters and liners on the Great Lakes or along the sea coast can be shown in impressive marine scenes to illus-

trate their massiveness and queenly beauty and make us long for a delightful dream trip to the well-publicized island resorts or an intriguing visit to foreign lands.

Marine photography lends itself well to the development of pictures showing action, and such action, when presented in an interesting pattern or rhythm, can produce beautiful pictorial results. Another phase of marine photography encompasses the presentation of atmosphere or mood, such as fog scenes, rough water, storms and squalls; or perhaps a brilliant day with sails of snow-white canvas arched by the wind against a cool, blue sky.

Equipment

Fortunately, almost any type of good photographic equipment can be used to take pictures along the water-front or from a wharf or dock. A steady tripod is recommended to avoid camera shake which could easily spoil a good picture. It is not so much the price tag on the equipment as the man or woman behind the camera which counts in getting an outstanding picture.

However, when making photographs from a moving

EASE AWAY

J. ELWOOD ARMSTRONG, FPSA

boat a small, portable camera with a sharp-cutting lens and fast shutter is highly desirable. A twin lens reflex of the Rollei type, a Medalist or a press type camera having a short focus lens is quite effective when the boats being photographed are reasonably close to the camera.

When one cannot move in close to the boats, such as during a racing regatta, it is desirable to have a camera with a longer focus lens which will produce a sharp image on the negative. A focal length up to about 6" would be

quite useful for this purpose.

My marine pictures have been made with a Rollei or a Super Ikonta D. The latter camera, although not available at present, takes sixteen exposures approximately 2x21/8 when using the split frame back. This camera has a 43/4" focal length Zeiss lens of high resolving power, and 16x20 prints can be easily made from a portion of the 2" negative. This lens provides a sixty per cent larger image than the 3" Rollei lens used from the same viewpoint.

Inasmuch as a tripod cannot be used when shooting from a moving boat, it becomes necessary for the photographer to hold himself and the camera as steady as possible. With a Rollei on a neck strap this is easier to accomplish than

with a camera held at eye level.

Some pictures can be taken at a speed of 1/100 second on a quiet day, but most of the time, better results will be obtained at 1/250 second. When the weather is rough, use 1/400 or 1/500 second to get as sharp a negative as possible. When exposing at 1/250 second with a G (light orange) filter in bright sunlight with high-speed film, the aperture would be set at approximately f/8. With a lens of 3" or 4" focal length, ample depth of field is available if the camera is focused in the proper manner.

If the boats are in constant motion it is advisable to use the "zone" method of pre-focusing. This eliminates the problem of focusing the camera at the time the picture is taken. For instance, in using a Rollei, the focusing knob on the camera can be readily set with the "infinity" marker on the number of the f/stop selected, and the photographer can tell the depth of field available at that stop. In the case of the 3" lens in the Rollei at f/8, and pre-focused in this manner, the depth of field or area in which the picture will be sharp is from 27 feet from the camera to infinity. In most pictures, boats do not come as close as 27 feet to the camera and therefore, this is the most satisfactory method by which to control the focusing problem.

When using the Rolleiflex or a similar camera the following data will be helpful in applying the foregoing 'zone" focusing:

Set infinity marker on

f/stop: f/3.5 f/5.6 f/8 f/11 f/16 f/22 Distance of

nearest

object in focus: 96' 45' 27' Suitable charts for other lenses can be obtained from your photographic dealer or data books on various lenses.

Of course, if pictures are made on board a sailboat, tug boat, etc., and the distance of the nearest object to appear in the picture is less than 27 feet, it will be necessary to focus the camera to take care of the needs of that particular picture.

Filters play an important part in making marine pictures, as most seascapes include a considerable amount of area devoted to water and sky. A colorless sky is uninteresting and distracting in a pictorial presentation.

The selection of the filter depends upon the type of day and lighting conditions. For most pictures including a good blue sky, with or without clouds, the K-2 or medium yellow filter will be quite satisfactory. If the sky is a weak blue, over-correction with a G or orange filter may be desirable. For dramatic effects a reddish orange or light red can be used, but usually the values in the water are made too dark and become uninteresting. A pola-screen can also be used, but the rapidly changing position of the photographer with respect to the direction of the light makes it difficult to use this filter in regatta photography. Along the waterfront it could readily be employed for darkening the blue sky and reducing the gleam of light on the surface of the water, with little effect on the other subjects in the pictures.

If white or gray clouds fill the sky, and very little blue is showing through, it will not do much good to use a filter. It will also be very difficult to record white sails against a white sky. The best solution for this problem is to take the pictures on a day when the sky is blue and only a few clouds are present. Clouds can also cause a lot of trouble for the photographer by being in the wrong place in the picture. For instance, a large, puffy, ball-shaped cloud perched on top of the mast, or heavy clouds on the same side of the picture as the boat create a feeling of poor balance. When boats are racing it is rather difficult to watch the exact placement of the clouds as well as the boats. If the clouds are the faint, wispy type they will cause little difficulty no matter where they are recorded in the picture space.

When the sky is blue, but devoid of clouds, the print can be burned in from the top to accentuate the normally light area at the horizon. If it is felt that clouds are desirable to enhance the pictorial value of the picture, they can be printed in through the use of one of several well-known

Orthochromatic film is good for marine photography, but panchromatic film also gives splendid results. If a light green filter is used with panchromatic film an effect similar to the use of ortho film is obtained.

Owing to the brilliant reflection of light from the water and sky it is essential that a sun shade be used on the camera. This accessory cuts down on the stray light bounce and improves the crispness of the negative.

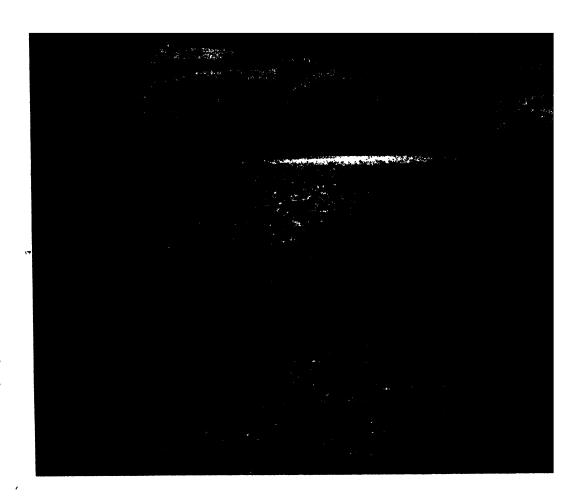

There is a slight variation in the operation of all equipment. Therefore, to obtain best results, familiarize yourself thoroughly with your own camera, enlarger and other accessories by making adequate tests for this purpose.

Exposure and Development

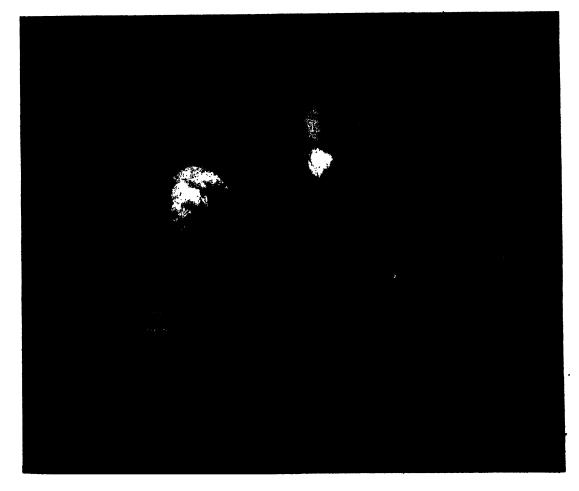

The exposure and development of the negative is a very important part of all photography. It is particularly necessary to watch the exposure and processing of marine negatives due to the variation in the lighting conditions and the brilliance of light in the large areas of sky and water.

At the outset it is important to differentiate between the diffusion-type enlarger and the condenser-type. If you are using 4x5 negatives and a diffusion-type enlarger, they should be exposed and developed as to obtain a full-bodied, crisp negative to get the best results in the print. However, if a small camera is used and a condenser-type enlarger, the negative should be relatively thin and of soft contrast for high-quality prints.

Good results can be obtained with either enlarger, pro-

SUNSET SILHOUETTE

THROUGH THE DRAW vided the negative is exposed and processed to obtain the type to suit the characteristics of the enlarger to be used.

Assuming the use of a Rollei type of camera with a $2\frac{1}{4}$ " square negative, we should expose and develop according to the inherent contrast in the subject and lighting. Perhaps we should try to classify a few subjects for a better understanding of the contrast problem. The best pictures are made early in the morning or late in the afternoon, and during that time of the day the light, coupled with the inherent contrast of the subjects, is usually rather contrasty.

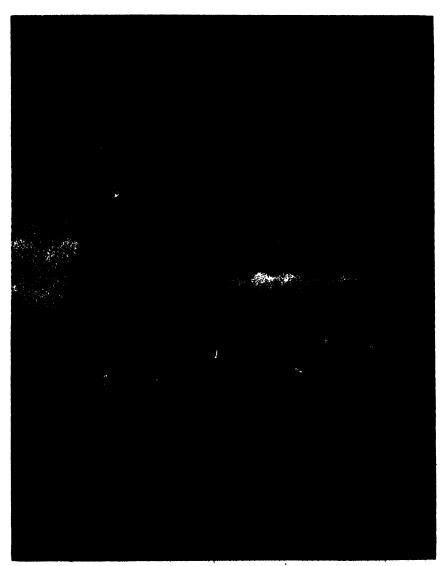

A range of tones of approximately 1 to 128 can be recorded on film when viewed by transmitted light, if exposed and developed properly. This is from U to O on the Weston meter or about 7 stops on your camera. However, this great latitude of the film does not solve our problem, as the latitude of the printing paper is only about 1 to 30 by reflected light, on normal grade. This range is much less for hard or very hard grades of paper.

Therefore, when printing on a condenser-type enlarger, which increases contrast in the printing process, the negative tones must be compressed so that they will fit reasonably well on the printing paper. In other words, we must overexpose and underdevelop the negative according to the existing contrast in order to reduce the gamma to get

a better-printing negative. The extent to which you overexpose and underdevelop is gained primarily from your own experience with the type of subjects photographed under certain lighting conditions. As a general guide you might try doubling the exposure and using approximately two-thirds of normal development for a condenser-type enlarger.

If a small negative size is used, such as a $2\frac{1}{4}$ " square or $2\frac{1}{4}$ x3 $\frac{1}{4}$, it is advisable to use a fine grain developer, such as DK-20, so that 16x20 exhibition prints can be made from the negatives without showing too much grain. The negative should be exposed to have some detail in the thinnest parts, and should be developed so that the highlights of the subject are printable with good gradation of tone throughout the print.

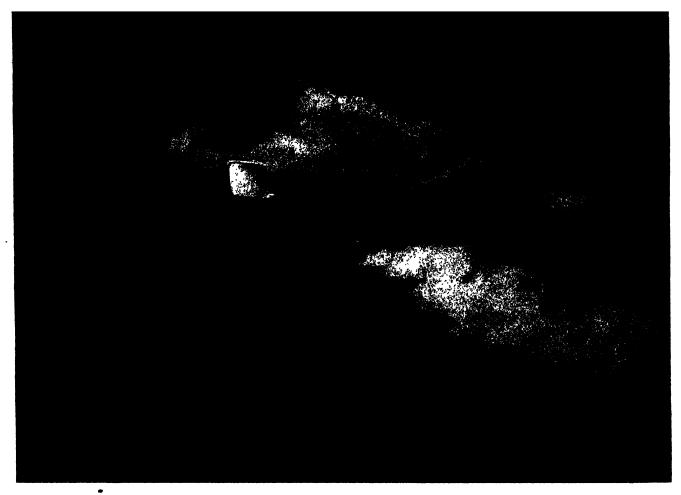

In bright sunlight be sure to take advantage of the early morning or late afternoon shadows to improve the perspective and apparent depth in your pictures. Flat light in the middle of the day makes the pictures dull and uninteresting and should be avoided. The use of side and back lighting will dramatize a subject and add immeasurably to the pictorial interest in the scene. Many outstanding pictures have been made at sunrise and sunset using the oblique light from the sun to emphasize the focal point of interest.

LIKE PAINTED SHIPS

J. ELWOOD ARMSTRONG, FPSA

The repetition of triangular forms makes an interesting composition and the quality of the water suggests a calm, peaceful scene.

FLYING SPRAY

J. ELWOOD ARMSTRONG, FPSA

The pattern of spray is an interesting design and illustrates action recorded at the psychological moment as the speedboat cuts through the wake of another speedboat.

Heavy mist or fog can enhance the feeling of a picture. In studies of this type you can utilize the atmosphere to help convey the mood and to obliterate unwanted background material which would otherwise be very distracting. The fog effect in some instances can be accentuated by the judicious use of a blue filter to increase the appearance of the wet, misty atmosphere.

Lighting

What kind of lighting is best for marine photography? This is really a \$64.00 question! Marine pictures are made under all types of lighting conditions. Night pictures along the water front, early morning, dawn or fog scenes, brilliant, mid-morning sunlight effects, flat lighting from overhead during the middle of the day, brilliant sunlight in the mid-afternoon on open water, or pictures during squalls or heavy weather at anytime of the day, all present variations of lighting contrasts. Therefore, the photographer should not wait for ideal lighting conditions, but make the most of prevailing light at the time the pictures are taken.

Pictures taken on calm, peaceful days can be very beautiful if this effect is dramatized as much as possible. However, when racing sailboats are involved and a brisk wind is blowing, with mid-morning or mid-afternoon sunlight accenting the large, billowing sails, outstanding marines can be made, if the photographer is prepared to shoot quickly and carefully to capture the picture at the psychological moment.

This is also true in early morning fog scenes and during storms or squalls when the weather is rough. The best fog or stormy atmosphere pictures are taken as the weather changes and the sun breaks through. Although the allowance for exposure under such lighting is difficult, dramatic pictures of this type cannot easily be repeated unless a similar weather condition prevails.

Marine photographers should make every effort to take mood pictures whenever possible, as this opportunity presents itself only occasionally. However, when such pictures are properly recorded they will live forever, as the famous picture by A. Aubrey Bodine, FPSA, of oyster dredging in a squall, which has been exhibited and reproduced many times and won a \$5,000.00 war bond in the "Popular Photography" contest a few years ago.

An important consideration is the direction of the light on the subject. Is the light coming from behind the camera and falling directly on the subject; is it hitting the subject at an angle, giving a strong side lighting or is the subject backlighted? These various light conditions should be studied and allowance made in the exposure and development to compensate for the direction of light. Of course, when you are photographing moving boats from a speedboat the problem becomes more complicated in adjusting for a constantly changing light direction. Most of the time you just shoot with a rough estimate of the proper allowance for light conditions, based on previous experiences.

If the boats are in a sailing regatta or race, the action is fast and compositional patterns, as well as the light, change rapidly. Considerable concentration on the part of the photographer is required to do everything just right, in view of the constant change in conditions. What you are going to do under certain circumstances must be determined in advance, and should be remembered until after the race, as there is no time for making notes while the action is taking place. Whether the picture is successful or not depends, to a large extent, on the ability of the photographer to recognize the lighting condition and expose accordingly.

Picturization

Some of the finest subjects are found away from the docks and the main shoreline. You will want to have the fun of getting in a small rowboat and doing a little searching of nearby coves and beaches. A great part of the thrill in photography grows from your own personal discovery of a subject which is particularly suited to an unusual angle of view.

While many good pictures have been taken at eye level, try finding a viewpoint with a high angle or from a low angle to get a different approach to the scene. Shots from a high point of view add to the potentialities of the subject through the introduction of interesting patterns and designs. Those from a low angle can be used to impress the viewer with a majesty and massiveness of the big ships.

If you have a camera with a shutter speed of at least 1/100 second, action shots of speedboats in races or sail-boats turning a marking buoy provide a real thrill in picture making. Here, fast, co-ordinated action in using your equipment and sensing good picture possibilities offer rich dividends in outstanding photographs.

Check your local newspaper for dates on which regattas and races will be held. Be sure to arrive early to photograph the sailors getting the boats ready for the race, as well as the actual race. You will have an enjoyable experience as well as some unusual pictures.

Boats in a race can easily get out of range of your normal lens. If your uncle out west dies and leaves you a legacy, you might want to invest in a telephoto lens or an auxiliary camera with a long focus lens to cover the long shots during a regatta.

Care should be exercised in shooting pictures of moving boats to avoid annoying line and point mergers. This is particularly true of eye-level shots of sailboats, inasmuch as the boom readily merges with the distant shore line or horizon. When the boats are in action it is easy to lose sight of the mergers and not discover them until it is too late—at the time you want to make the prints in your darkroom.

Wherever possible, use people as an accent in the scene to give contrast of size, but do not have them looking at the camera. They should be posed doing something or looking away from the camera toward the principal subject. Otherwise, they will steal interest from the boats which should be emphasized as the center of interest. Do not have people too close to the camera or their size will be out of proportion to the smaller images of the boats which are farther away.

Include wharves and simplified props for carrying out the idea of your scene. Do not stand on the edge of a river or lake and snap a picture of a single boat without including a suitable foreground for a base. Step back and include part of the wharf or other interesting material to frame the picture and create the illusion of depth.

Be sure to give consideration to your proper point of focus so that the foreground material will be sharp even though the boats in the far distance may be more softly rendered. Care should be exercised to see that the point of interest is properly emphasized by lighting, contrast of tone, size and shape, and position in the picture space.

In many instances a pattern of boats, such as a line-up of canoes, rowboats or sailboats, can be used as a pictorial subject. Boats in a race make interesting patterns if they are photographed with a large boat in the foreground, another in the middle distance and a third farther away. This type of picture not only is pleasing, but gives the impression of considerable depth.

It is not necessary to show the entire boat in all pictures. Try compositional studies showing only a portion of a boat to convey an interesting pattern or design.

For the most satisfactory results marine pictures should be printed on luster or glossy papers to show the fine detail of the water and texture of the sails. Strive for real print quality in the highlights as well as the shadows. Mat papers can be varnished or waxed to improve the apparent range of tones in the final print.

Blue toning in the thiocarbomide-gold chloride formula enhances the presentation of the picture. Do not overtone and obtain a blue that is too deep in value. A blue-gray is a good shade to use for marine pictures. Some scenes, such as sunsets, may be presented in sepia tone, but for the most part they will be more successful if they are shown in the big, blue and glossy technique.

Adequate planning of the possibilities of good marine pictures cannot be overemphasized. In fact, one should carefully study pictures of this type which have been made in the past, as a guide for the selection of interesting waterfront scenes.

Search for a good compositional pattern and expose under the best lighting conditions. Consider the inherent contrasts of subject and lighting, and develop accordingly to obtain a top-notch negative with an excellent gradation of tone.

Waterfront scenes are available the year round. During the early spring and summer months many regattas are held; commercial transportation continues in most ports even during the ice and snow of winter, and the brilliant days of early fall leave nothing to be desired. Can't you feel the urge to make some real marine studies? Perhaps you will have the insight to find and present an outstanding picture of unusual merit portraying the dramatic action of a race, an excellent compositional pattern or one of the many intriguing moods of the sea.

Real pictures are there—waiting to be captured by your lens. Will you meet the challenge? Why not give marine photography a serious try, and make that outstanding picture you have always visualized in your dreams?

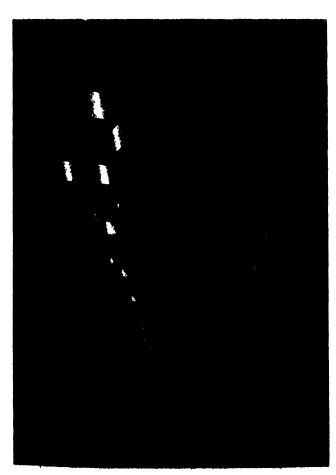

TABLETOP SNAPSHOTTING

LA VERNE L. BOVAIR, APSA

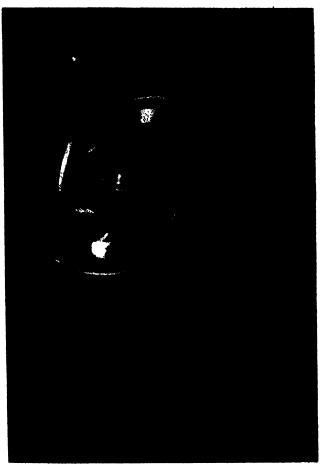

PHOTOGRAPHY is like a diamond, its many facets reflecting different kinds of pictures and varied methods of making them. Photography is also like music, for the photographer can create a picture of symphonic magnitude, or one comparable to a simple melody, both of equal importance in their own sphere.

Pictures have been of interest since the early dawn of mankind, and the child, watching his cave-man father cut and scratch on the cave walls, was just as interested as is the youngster of today viewing Hopalong Cassidy gallop across the electronic prairie.

As mankind progressed, so did his ability to produce better pictures, and today we have that perfect tool, the camera. This mechanical device has given us a splendid means of communication equal to any yet invented, for it has made it possible for the individual who is artistically

LINES IN MOTION
PSA JOURNAL, Vol. 18, Apr. 1952

R. P. M.

inclined, but lacking skill with pen or brush, to present his idea of a picture. The camera has accomplished that miracle of miracles, the stoppage of time in space—capturing a fleeting moment and freezing it into everlasting reality, preserving for all time images of loved ones and moments of great importance.

This magic mechanism, watched over so carefully by technicians, engineers and men of great scientific skill, is ours to use freely. It has been placed in our hands to be held tenderly, used carefully, and to be respected for what it is—a modern miracle.

Many people use cameras, for different reasons and for various kinds of photographic work. Pictorial designs, portraits, documentary records and many other types of pictures are made every day, but the choice as to subject matter, manner of presentation, and method of making them are in the hands of the photographer himself.

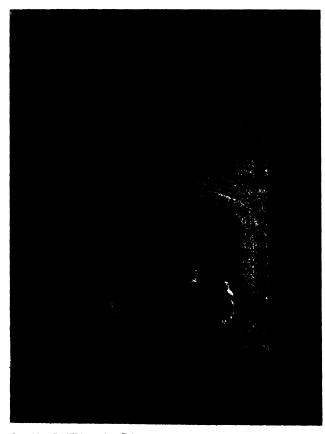

Commercially, the camera buys and sells, proves and disproves. The professional seeks out a method that is both popular and profitable, while the amateur turns to the type of picture that offers him the most pleasure. Both are a means to a particular end.

A man works best when he is free to choose his job, and the same holds true in a hobby. I like to build tabletops; but I must confess that the development of an idea and the construction of the parts are much more enjoyable to me than the use of the camera and the resulting darkroom work. However, I realize that one is just as important as the other and endeavor to come up with results as nearly perfect as possible.

Carving, whittling or moulding a figure for a tabletop is easy for me, but when it comes to making the print I have to exercise great care in every detail. Houses, walls, trees and mountains—even a space ship—all fall into place quite naturally, yet my patience is more or less tried in developing a roll of film. I must have a good negative to work with, so I use every bit of technique I possess to make sure the result is satisfactory. By this I do not mean

that every print is perfect, but I do my utmost to see that it is as good as I can make it.

Tabletop photography has much to offer in the study of the fundamentals of lighting and the arrangement of subject material. I strongly recommend it to the beginner as a means of learning to handle light—the tool that photographers use at all times. Light is the pigment with which you paint your picture, and a complete knowledge of its characteristics is important in all phases of photog-

BEYOND THE KHYBER

raphy. Composition is also important and can be mastered much more easily by applying the rules of design to still life setups,

Tabletop photography has many advantages as well as some disadvantages. You have complete control, and therefore the responsibility for the quality of your print is entirely in your own hands. There is no excuse if the lighting is poor, for you are the controller of that light. If there are mistakes that mar the picture, you cannot escape the blame. On the other hand, if the picture is successful, you can take pride in its entire creation, and therein lies the emotional satisfaction derived from tabletop photography. So be careful, take your time and get it right; use every skill and idea at your command to bring into being your true conception of a picture.

A good imagination is important in this branch of photography, but not everyone is gifted in that respect. Imagination, however, can be cultivated by practice, and I recommend the building of tabletops as a means to this end. Ideas for pictures are all around us—in books, games, songs and proverbs, the movies and store windows. Look around you and find out for yourself! You may even copy another's idea, but do it better—or leave it alone.

In my younger days I was associated with an amateur theatrical company and had the opportunity to learn the design and construction of stage settings. To acquaint the cast and stage hands with their cues and movements, we often built miniature scale models of the scenes, and we kept them on display all during rehearsals. I had previously done some scale model construction of my own modern furniture designs, so the job of building model stage settings fell to me.

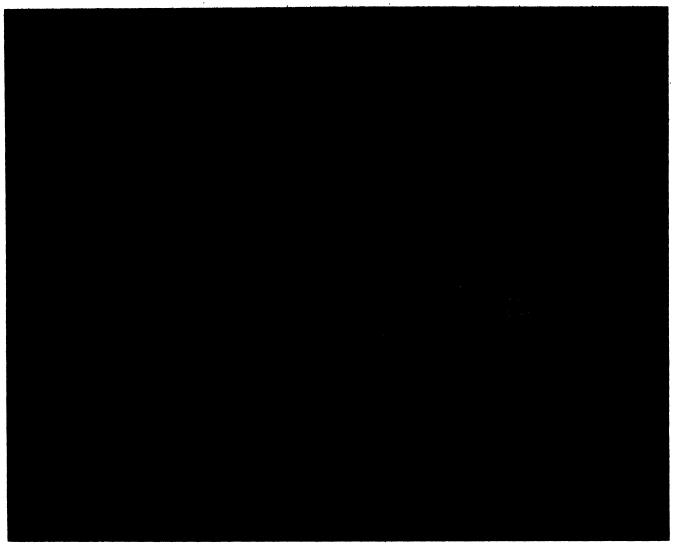

When I decided on photography as a hobby, I realized that I would not be able to travel far afield to take pictures, so naturally I turned to my old hobby in search of subject material. The theatrical experience has served me well in my tabletop work.

Design being a most important element of any art or craft, first I make a few simple sketches that help to develop and establish a well-organized pattern, and later serve as a refresher if I tend to wander from the original idea. This method of designing the tabletop is sometimes carried farther, and a bit of color is worked in to insure realism. Form, texture, luminosity and lighting are also kept in mind in the initial sketches.

Humor should never be neglected, and many of my prints border on the cartoon style. In fact, because of a certain type of building I have used in some of my prints, I enjoy a dubious reputation that is closely akin to the one gained by Chic Sale. I have also won all of the screwball print contests at the Guild—to the extent that the executive committee decided to abolish the contest. What price glory! People like to laugh, and as a photographer you should help them to do so.

I have been asked about the tools with which I work, the camera I use and the technique I employ to achieve the effects in my pictures. The average house contains all the tools necessary to produce a tabletop. A small saw, a sharp knife and a pair of pliers will do for a beginning; later you can add any other tools you require. Cardboard, plaster and water color are the principal elements of most of my tabletops. I paint my settings and background, or sometimes use large calendars. Scenic backgrounds can also be projected on a translucent screen behind the set. The methods of actual construction are so varied, and

HILLTOP FANTASY

LA VERNE L. BOVAIR, APSA

depend so greatly upon the maker's skill, that it is difficult to explain the technique in a general way.

My camera is one that I rebuilt especially for this work. It is a Trona 212 Ica, with a Zeiss Tessar f/4.5 lens and a Compur shutter. It takes 3½ by 4¼ cut film; however, I rebuilt the back so that I could also use 120 roll film and 2¼x3¼ cut film. This makes a very versatile instrument. From the optical standpoint, the large lens and smaller film gives me the advantage of working farther away from my setting, thus obtaining better perspective and less distortion.

Usually my prints are the big, blue and glossy variety that is familiar all over the country, and is so closely associated with the Photographic Guild of Detroit. However, I do make a few matte prints, and like them, although I prefer pictures that are striking and have dynamic appeal. The popular glossies are honest pictures; they reproduce well and contain a wide range of tones.

A certain amount of experience is necessary in modeling and constructing miniatures, to enable one to set up a tabletop rapidly. "Hilltop Fantasy" did not require much effort—it was assembled and photographed in about two hours. This was a combination of dime-store articles and hand modeling. The hill, tree and fence were made by hand; the horse was purchased. The tree was made of wire covered with strips of cloth; the foreground, representing a plowed hillside, was actually sawdust, and the fence was cardboard. The background was painted on a 4x5-foot card, using a 4-inch brush and black and white house paint, applied with bold strokes. Placing it 8 feet behind the setup threw it out of focus, blending the coarse brush strokes by diffusion. This little trick added realism to the sky and required no great artistic skill.

The abstract form in photography offers a creative approach in expression, and gives a wide range for experimentation, by exploring design with non-objective patterns to express space and movement. This kind of investigation can make a contribution to pictorial photography through its structural beauty. Working with pure lines and honest forms one can produce a vibrancy when these edges come in contact with light. This is what I have tried to do in "Lines In Motion."

Sometimes I try to make my appeal through the dramatic approach, and I believe I succeeded with "Freedom Of

The Press," by the use of strong, vertical lines for emotional impact. Back lighting always helps to dramatize, and was employed with telling effect in this case. A behind-the-scenes view would show that this tabletop was made of very simple props—newspapers rolled around fruit jars and fastened with scotch tape. The figure was once a shepherd peacefully tending his sheep. He was drafted! His shepherd's staff became a sword, and a shield of hammered brass was fitted to his arm. The front page of the daily paper was used as a base. The freedom of the press is a cherished right and deserves to be guarded by a strong, militant people, because it, in turn, guards our freedom. So much for the dramatic and social significance.

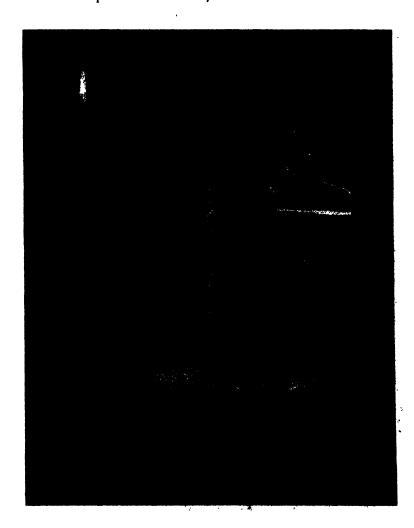

Working in what I like to refer to as a "motivated atmosphere"—or, more prosaically, a machine shop—whirling gears and wheels are a part of my everyday life. It is only natural, therefore, that I see the rhythmic motion and lines in the movements of the various machines, some going up and down, some back and forth, always driven by the whirring, whirling gears, belts and pulleys. To the veteran worker, all the noises and movements are commonplace and natural; any change in the tempo is noticed at once, and many an accident has been prevented because some keen eye or ear has detected a sudden change in appearance or sound. To the stranger it is awesome and frightening, and he walks among the machinery as if all the metallic monsters are going to leap upon him at once. Music has been written about the tempo of machinery, and I have been bold enough to show the smooth flowing motion of it in "Revolutions Per Minute," or simply "R.P.M." This print has hung in many salons and has been reproduced many times. The unique idea is not so much the spinning top, but in the fact that the background is spinning also. The form and mass, besides rhythm, cannot be overlooked in this design. It also points out the principle that a simple subject well placed usually makes a good picture. "R. P. M." is my favorite print, and I shall have to work hard to make something that would please me more.

In the two prints "Beyond The Khyber" and "There Is Always Tomorrow" I have achieved perspective by what I call size, or comparative contrast. In the first, the figure in the doorway is compared with the bottle holding the candle, thus the effect of distance is accomplished. The scene is a typical border cantina, and one has the feeling that he is sitting at the table gazing at the moonlit doorway through the veil of smoke ascending from the cigarette in the ashtray.

In "There Is Always Tomorrow" the construction is like a stage set. The walls are cardboard covered with plaster, the table is a piece of plywood, and the floor is also of cardboard. The small, reclining figure is hand made of clay, while the tree from "Hilltop Fantasy" was used as a prop in the garden.

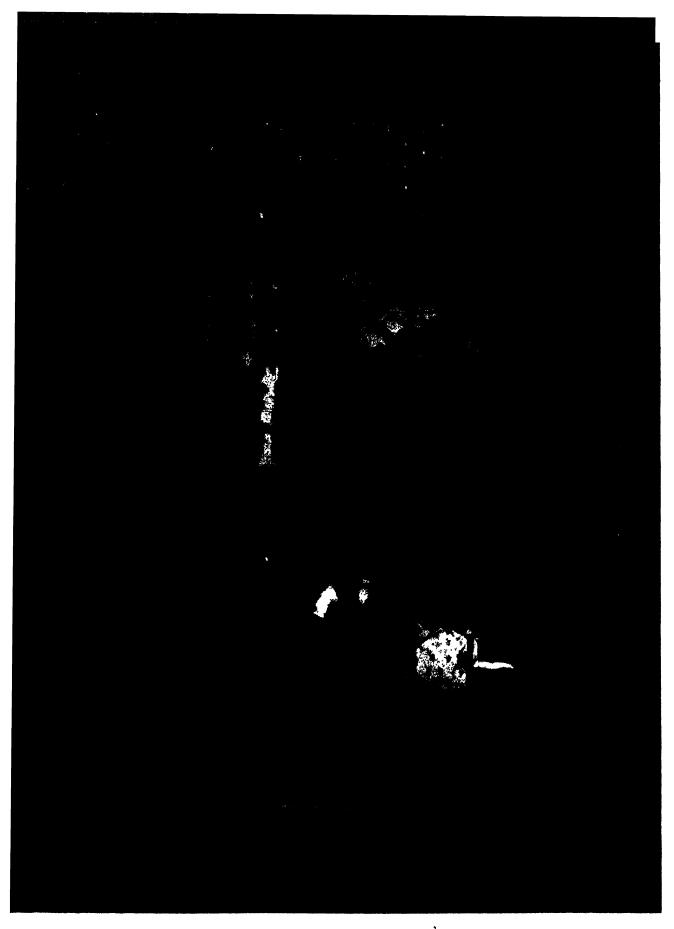

"Beyond The Khyber" employs the same technique in using the arch of the window and the small jug in contrast to the men in the doorway across the street. The figures and the jug are only 8 inches apart. I believe it is much more simple to achieve perspective and depth in this manner than to attempt to build it into the setting.

Tabletop photography is a wonderful means of self-expression, for it allows us to give free rein to our imagination, and we can do as the painters do—move a telephone pole out of the way to improve our composition. In its unlimited realm is found the answer to the photographer's search for subject material.

THERE IS ALWAYS
TOMORROW

LA VERNE L. BOVAIR, APSA

Portraits of Places

GRETCHEN H. GOUGHNOUR, APSA

PLACES, like people, have faces. The place may be a home, a shanty, a wigwam, a speakeasy or a parish. The people living within, place their stamp of personality on the exterior, and create a face. Unlike people, places sit quietly and wait for us to take their portrait. If we are lucky, we can catch the most characteristic expression on the first try. However, the more familiar we become with the subjects' facial variances, the more successfully we photograph their individuality.

To arrive at a satisfactory portrait of the human face, the correct camera angle plus the proper lighting must be used to bring out the most pleasing likeness of the person. If this is done, we have made a good, straight portrait of the subject. We can also make a good, straight portrait of a place, and a real-estate salesman will love it and sell the place because of it. However, we are interested in that extra something that turns a straight portrait or record into a pictorial photograph. In human portraiture, some knowledge of the personage plus the addition of accessories associated with him can be the deciding factors in making a pictorial camera study. In portraits of places, extra touches are also necessary to lift the finished print from a recorded copy of the place to a pictorial description of it.

All the attention given to a human face is necessary when photographing a place. You must look at it, around it and through it, using not only a worm's-eye but also a bird's-eye view. To look at it, you must go back from time to time to find the most flattering lighting. Consider morning and evening light, the absence of light in fog and rain, and judge whether spring or winter shows it off to the best advantage. When you look around it, estimate whether the portrait of the place can be taken in a straightforward, head-on manner, at eye level, or whether an angular camera position, at some other level, would be an improvement. Use your judgment, also, in composing for a full figure or a close-up view. In looking through the place, you may have the opportunity to catch the figure of the occupant sitting inside.

As in still life photography, a place must either be so beautiful that nothing else is left to be desired or the component parts so interestingly put together that the story-telling appeal is paramount. A beautiful pattern shot in still life, a beautiful girl in portraiture, or a beautiful architectural study of a place—these are all complete in themselves. A story idea does not necessarily depend upon beauty, but rather upon the high interest excited by the place and how well the story of the people living within is presented. If the story is well told and emotional stimulation is felt, you have made a pictorial portrait.

It is easy to be on the alert for pictorial portrait possibilities involving your home surroundings. For instance, your own back door has a face. Watch for its transformation from the familiar to the unfamiliar by changes in

lighting and weather conditions. On a cold night, with warm lights inside, it has the face of friendly hospitality.

ALL IN BUT

THE SKIS

On a rainy day, with the cat huddled in the doorway, it has the appearance of desertion.

Our house is not a glamorous beauty but just an average, middle-aged matron who, if given enough attention with camera angle and lighting, will be attractive in the finished print. Combined with her lack of architectural pulchritude, a story is told as evidenced in the print "All In But The Skis." We like to think of this print as an outdoor still life which ties our family life and activities to our home. In the print, winter has closed in with a spell of zero weather and the garbage can has been brought near to the door for obvious reasons. The milk bottles have been set outside and the skis have been left in the handiest place by a thoroughly tired-out boy. This is the story of the familiar things of home.

In the picture, nighttime serves its purpose by giving us our lighting from an out-door lantern which concentrates itself on the central portion of the composition. There was no need to set up the camera before total darkness, either for seeing the composition on the ground glass or for exposing at that time for shadow detail. There was light from the lantern itself and enough reflected light from the snow that had fallen earlier in the day to take care of these two nighttime difficulties. A meter reading was easy to obtain. Since the contrast was high, over exposure and under-development of the negative was resorted to in order to keep within the tonal range of the paper.

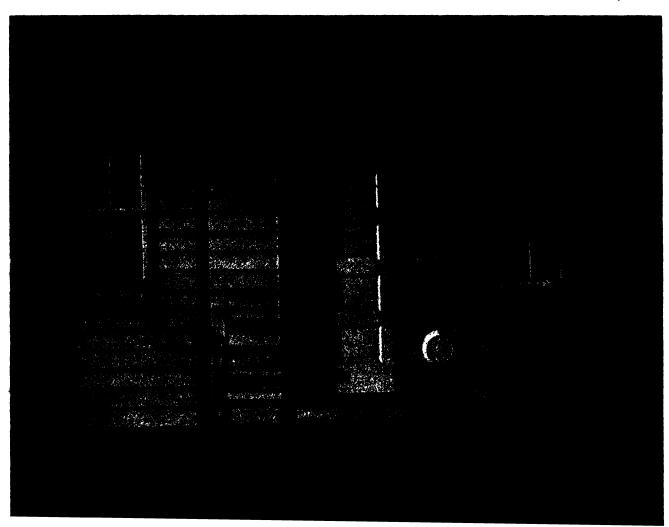

To someone living in the Pennsylvania Dutch section,

the place or home of an early settler tells an interesting story photographically. In early times the need of close proximity with a neighbor, plus the natural frugalness of the Dutch, made the building of row houses popular. They stand in comely and proper rows, their windows brighteyed with cleanliness. One of these homes intrigued us because it stood apart from the others. Two centuries had come and gone, and it was still waiting for another house to be built against it. Its air of expectancy prodded our curiosity and, as the Dutch would say, its pictorial possibilities "wondered us." Living nearby, we kept our eye on the changes made by lighting and the seasons, with the intention of catching its personality.

By day, "Dutch Simplicity" is just another house in a confused setting with too much shrubbery in the background. This confusion, which caused a problem of merging tone values in daytime, is obscured by the darkness of night. After deliberation, a full-length portrait was settled upon to make use of the solitary light in front of the house, which added to the feeling of aloneness. The pole and light wires were so placed as to further enhance the composition. The lighted window is a supporting touch, for without showing the actual figures of the occupants, it conveys the idea of secluded habitation. The camera was set up before dark in order that the composition could be seen more clearly on the ground glass. The negative was exposed at dusk, directly after the street light was turned on, thus retaining some detail in the dark areas.

HOME IS WHAT YOU MAKE IT

GRETCHEN H. GOUGHNOUR, APSA

Whereas "All In But The Skis" and "Dutch Simplicity" leave the presence of the human occupant to inference, "Morning News" is made for those who want a figure introduced in the print. Sometimes, the physical form of a person is indispensable to the end result, as in this close-up portrait of a porch. It is a natural place for people to congregate so why not picture it with people? This obvious conclusion is not subtle but neither are familiar, traditional things subtle.

The little, Victorian vacation house was directly across the street from us this summer and we noticed its charm the first morning as we stepped out the front door. Its quaintness was reminiscent of the gay nineties. The old tree, framing its face, contrasted with its delicate proportion and formed the photographic focal point of interest. A number of negatives were made with different arrangements of two persons at this point. A story-telling picture was achieved by injecting a feeling of movement in the figures. The shadows cast by the leaves had to be watched, for if they spilled over to the figures, spottiness and confusion would result.

The house was fixed in our mind's eye as a vacation place near the water's edge. However, to the viewer of the finished print, the house could be anywhere. For this reason, the porch was undressed of much of its properties, such as starting flags, oars, and an engine that would clutter the background and confuse the picture story. Details that are out of keeping show up ruinously in the final result. With a little extra time and forethought, they can be excluded.

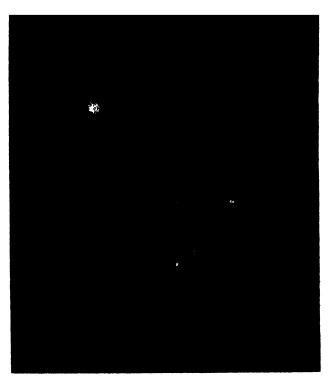

There was no need to wait for a change of seasons or unusual lighting conditions; any day with good 9:00 AM sun would be in keeping with the idea we had in mind. In bright sunlight, the lighting contrast from the white house to the shadows in the tree was high, and beyond the capabilities of photographic paper. We could have waited for a day with softer light but again, with overexposure and underdevelopment, an easily printable negative was made.

The milk house in "After Milking" appealed to us because of its sturdy, substantial lines. It looked as clean and as stable as the Dutch who live in this district. Seldom is there a building left unpainted or a blade of grass left untended in this country of earthy people. They are a simple people whose life is spent tilling the soil and caring for animals.

This building, while interesting in itself, is not beautiful enough, architecturally, to be a pictorial study. It requires a story idea to indicate its purpose. As we do not have exterior supporting touches, as in the ski picture, to get our story across, the figure with the bucket going about her daily task is used. In order that a static appearance may be avoided, try several exposures of the model so that the best action and placement can be selected.

The camera was held below waist level to see under the wide overhang of the roof and to look up slightly at the model. A nearly-full-length portrait was made of the place because the figure, although of importance, was subservient to the compositional design of the milk house and tree.

Sun was necessary for the cleanliness that we wanted to feel in the print, and a fairly soft lighting effect was obtained by a late fall sun. The contrast from the dark roof to the freshly painted building accounted for the slight overexposure and underdevelopment.

DUTCH SIMPLICITY

GRETCHEN H. GOUGHNOUR, APSA

The tiny, spare house in "Home Is What You Make It" had a practical aspect about it that bespoke of the male's touch in its management. Its little front porch had an exterior utilitarian arrangement that only a man would be brave enough to display. The broom was for sweeping, the basin for washing, the cloth for scrubbing and the chair for sitting.

Aesthetically, the direct, frontal approach to simple subject matter is the logical one. From a front-view camera position, the early morning light gave an interesting, pleasing distribution of light and shadow. Long shots were taken of the entire house but they did not tell the story of practicability as well as the close-ups of the four articles mentioned above. The negative was overexposed and underdeveloped.

Do I always overexpose and underdevelop a negative? No, not always. It was necessary with the five discussed in this article because of the high contrast of white houses in sunlight or the usual high contrast found in doing nighttime photography.

The kinds of faces we have depicted in our examples are summed up as follows: First, "All In But The Skis"—the familiar face; next, "Dutch Simplicity"—the lonesome face; third, "Morning News"—the pleasant face; fourth, "A Home Is What You Make It"—the everyday face, and last, the clean face found in "After Milking."

Photograph the face that appeals to you most, whether it be a clean face, a dirty face, an interesting or a beautiful one. If it is a beautiful one, make it emotionally appealing through its sheer beauty and perfection. If character rather than beauty dominates the face of a place, give it all the assistance of properties to tell the story. In the telling, leave enough to inference in order that the viewer's imagination will be stirred to the point of adding his personal experiences to yours. If this is done, the portrait of a place has a good chance of universal appeal and acceptance.

How Do You Know?

JOHN R. HOGAN, HON. PSA, FPSA

THAT LAST picture you have been working on—I'll bet you really went to town and did a job. You remembered all the things you learned from more experienced photographers; you referred to helpful articles in magazines and books; you were careful to follow the methods recommended for the products you used; you were generous in feeding the waste basket, and you put in plenty of time and trouble in spotting and finishing the final print.

You are rightfully proud, and believe you have a really good picture, but how do you know? Folks, the answer to that question is as easy as rolling off a log—you don't!

No matter how well any of us may like the idea back of our picture or how clever we believe it to be, no matter how interesting the subject matter, no matter how much time and care we used in making the print, we can't be sure the picture is good until it has been judged by people who don't know who made it, in competition with other pictures of the same type, made by other people. If it passes that test it is a good picture and we know.

So many people say, "I make pictures to please myself; I don't care what other people think of them." The chances are that they are suffering from an inferiority complex, and deep down in their hearts they really do care a lot, but are afraid other people will not like their work as well as they like it themselves. That fear is wrong, and it doesn't make sense! The best photographers in the world turn out plenty of bad pictures, but don't realize it until they have been thrown out of exhibitions or refused by buyers. No one, amateur or professional, is capable of judging his own pictures with any assurance that he is right. People are too close to their own work—it takes outsiders to get the proper perspective.

Most of us make pictures for the satisfaction we get out of them and primarily to please ourselves, but the supreme pleasure comes only after we find that others like them, too—when we know they are good. Our Society, the PSA, had this in mind when it organized the Picture of the Month activity, and all of us can benefit from it.

There are classes for those who haven't progressed far enough in photography to make their own negatives and prints, and there are classes for the best photographers in the Society. There are classes for different kinds of pictures; for those who like pictorials and those who do not; for portrait photographers; for nature photographers, and for those who have advanced ideas and make prints by the most involved photographic processes. All will be seen by sympathetic judges who like and understand the kind of pictures you make, and everyone has an equal chance for recognition.

When your picture is good you will know it is, because it will earn you a Certificate of Award that says so, with your name and the title of your picture. You needn't be ashamed, either, if your picture doesn't make the grade, for no one will know anything about it, and the print will be returned to you, perhaps with a few suggestions for improvement. Records will be made only of the successful prints, and the points earned will be kept cumulatively from month to month, with special prizes at the end of the year for the best scores.

Competitions are fun and the surest way to make you improve your work. They create an incentive, and without incentive there is no progress. There is another advantage offered by the Picture of the Month activity that should appeal to you: the opportunity to be of help to others less skillful than yourselves. The point-winning pictures, with the permission of the entrants, will be mounted in books, with the makers' names and other information, and these will be presented to the PSA Library for circulation to interested groups. In this way the more successful photographers will be of service to those who were unsuccessful because they didn't know how a really good print should look.

There is one thing that beginners in photography should learn right away when they join PSA: the more experienced photographers, who remember they were once beginners themselves, are anxious to help them in every possible way to get the most pleasure and the most benefit from their work. You needn't be an expert to get into the fun; Picture of the Month has classes for beginners who did nothing but make the original exposure—the negatives and prints can be made by professionals at the camera store. In time you will graduate to doing your own work, and can enter the more advanced classes.

The old timers can have fun, too; making 8x10 prints as good as you can make them is interesting, and doesn't cost so much when you throw away the rejects. And the very best photographers have as many, or more, of these to throw away as the beginners, because they are more particular about the quality of their work.

Let's take a look at the various classes in Picture of the Month and see just where you can fit in.

Class 1. Open Pictorial.

No restrictions of any kind except size, and open to every member of PSA. Prints in this class will not be discussed when they are returned.

This is for the best photographers in PSA; the competition is stiff, and it is a real honor to win a Certificate of Award and have your winning picture published in PSA JOURNAL. We hope, through this means, to collect a large number of top-grade prints for the books we are making for the PSA Library, so that they will be a real inspiration to the less experienced photographers who don't know just how a real print should look. If you are as good as you would like to believe, you should have prints in these books! None of the prints in this class will be discussed, because the makers know as much about them as the judges and there is no need for discussion. For those of you who have been making top-quality, large prints,

I can say, from personal experience, that you will get a lot of fun from the 8x10 size, and will make the best pictures you have ever produced. Give it a try, folks, what can you lose?

Class 2. Advanced Pictorial.

For any member of PSA who makes his own prints, but has not hung more than two different pictures in two international, national or state salons. When prints that do not win Certificates are returned, they will be discussed by qualified analysts.

This class should be invaluable to those of you who are preparing salon prints to exhibit for the first time, or who have had too many rejections of prints you think should hang. Maybe there is some little thing wrong you haven't been able to see because you are too close to your own work. If so, our judges, who are successful exhibitors themselves and know what it is all about, may be able to put a finger on the weak spot. When you get your print back, or if it wins a Certificate, you will know the answer as to whether it is good or not, and maybe why.

Class 3. Beginners Pictorial.

For any member of PSA who made the original exposure, but had the negative or print processed by another, amateur or professional. When prints that do not win Certificates are returned, they will be discussed by qualified analysts.

Here is an opportunity for a large group of snapshotters who do not do their own work to learn more about the pictures they take and to experience the fun of competition. If your camera store technician doesn't do a good job, you can find out and make him do better next time, or you can have paints made by amateur friends who know how to make first-quality exhibition pictures. When you win Certificates, you can be sure your raw material is good, and you may be inspired to set up some equipment and do your own work. This is the first step to more enjoyment and better photography, and I hope many of you will take it.

Class 4. Open Portrait.

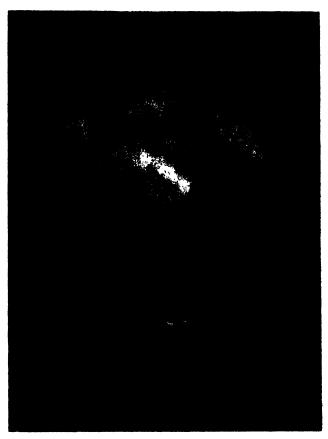

No restrictions of any kind except size, and open to every member of PSA. Prints in this class will not be discussed when they are returned.

This is for the best portrait photographers in PSA, amateur or professional, and we hope to collect a large number of high-grade portraits for the books we are making for the PSA Library. These books should be full of good ideas, and should be a real inspiration to those who want to make good portraits but don't know just how they should look. The Certificates of Award that will be sent to the makers of the honor prints are of top quality, made by a well known jeweler, and suitable for framing and hanging on your darkroom or office wall. No harm in showing others that your work has won national recognition for excellence!

Class 5. Beginners Portrait.

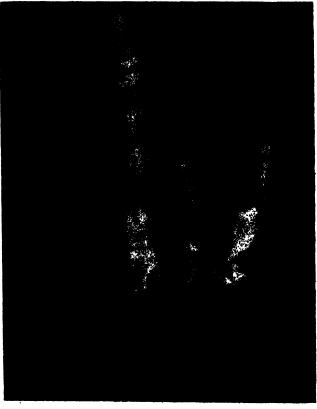

For any member of PSA who made the original exposure, but had the negative or print processed by another, amateur or professional. When prints not winning Certificates are returned, they will be discussed by qualified analysts.

This class is similar to Class 3 and should be used by the large group of portrait photographers who do not do their own work. It will be a valuable check on the quality

NOR'EASTER

No harm in showing others that your work has won national recognition for excellence!

Class 5. Beginners Portrait.

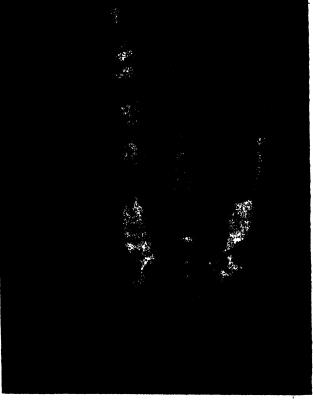

For any member of PSA who made the original exposure, but had the negative or print processed by another, amateur or professional. When prints not winning Certificates are returned, they will be discussed by qualified analysts.

This class is similar to Class 3 and should be used by the large group of portrait photographers who do not do their own work. It will be a valuable check on the quality

NOR'EASTER

John R. Hogan, FPSA

BIRCHES—CRAWFORD NOTCH

JOHN R. HOGAN, FPSA

of the prints you have been getting from your camera store, and may, in time, result in the installation of equipment to do your own work. These prints are as eligible for Certificates and Points as the prints you make yourselves, and you will have just as much fun in the competition as the advanced workers. And bear in mind that this isn't just local competition, it is international.

Class 6. Advanced Nature.

For any member of PSA who makes his own prints, but has not had prints accepted in any nature exhibition. When prints that do not win Certificates are returned they will

be discussed by qualified analysts.

This class does not compete with the regular print competitions of the Nature Division, for which you will receive entry forms when issued, and in which there is no restriction on print size or success in former nature shows. Maybe the experience in making prints for Picture of the Month will help you to success in the regular Nature Division Competitions; it might even prepare you to win one of their medals.

Class 7. Beginners Nature.

For any member of PSA who made the original exposure, but had the negative or print processed by another, either amateur or professional. When prints that do not win Certificates are returned, they will be discussed by qualified analysts.

This is similar to Classes 3 and 5, the only difference being in subject matter. Since nature and pictorial subject matter can be pretty much the same, you often have the option of entering your print in either class, with equal chance of success. The important thing is to *enter*.

Class 8. Abstractions, Photograms, Unusual Effects.

An open class for every member of PSA. No restrictions of any kind except size. Returned prints will not be discussed, but it is hoped that the makers will include discussions when they submit their prints so that they can be used with the winning prints when they are mounted in books for the PSA Library.

This is for the people who make photographs that are "different," and the sky is the limit! Solarization, reticulation, distortion, tricks of all kinds, novel ways of illustrating ideas, pictures that stimulate thought. Come on, you modernists, let's see some of the things you have up your sleeves!

This class is under the direction of Sewell Peaslee Wright, APSA, and a group of sympathetic judges who like and believe in your kind of photography.

Class 9. Personal Photography.

For every member of PSA whose pictures reflect his own feeling and thinking about any subject whatever, but who is not interested in "pictorial" photography. Maximum size, 8x10, unmounted; prints to be made by the entrant.

This class is under the personal supervision of Jacob Deschin, APSA, who will comment, at his own discretion, on selected prints, and select the three best each month for Certificates and publication in PSA JOURNAL. No points will be awarded in this class, but the winning prints will be mounted in books of their own class, with the permission of the entrants, and used for the further purposes of the Society.

General Information.

The maximum size of prints in each class is 8x10, un-

mounted, and each should carry on the back the title, name and address of the entrant, the class in which it is entered, the Division affiliations of the entrant, and the Pictorial and Portrait Portfolios to which he belongs, either as a regular member or commentator. Should you be unwilling to have us retain winning prints for further purposes of the Society, write PLEASE RETURN on the back, and we shall defer to your wishes.

Prints are to be mailed in strong envelopes that can be used for the return of prints, stickers, Certificates, comments, scores, etc., and return postage (first class) is to be included, because much of the returned matter may

be personal in nature and require it.

A winning print in each class will receive five points, second place three points, and honorable mentions one point each. There is no limit to the number of Certificates that can be won by one entrant in one month, but he can win only one score, that of his highest scoring print. This is to prevent a small group of the top photographers from winning all the points, and to give an equal chance to everybody. Scores are kept cumulatively from month to month, and at the end of the year there will be prizes for the best. While Picture of the Month has been running since the first of the year, there is still plenty of time to get into the running for yourself and for your portfolios.

All prints will be entered in the month during which they are received, and all will receive stickers. We shall take the best possible care of your prints, but cannot accept any responsibility for damage or loss.

Special Contest Between Portfolios.

Each print will have a list of the entrant's Pictoffal and Portrait Portfolios on the back, not including special or International Portfolios. When he wins points, they will be credited to each of his portfolios. These scores will be kept cumulatively from month to month and at the end of the year there will be special prizes for members of the highest ranking groups. If you really believe it when you say your own portfolio is the best, here is the chance to prove it.

Picture of the Month is only one part of a long-range plan to make your membership in PSA so interesting you will never let it lapse. Start right now to take advantage of the things that are offered you, and find out how important PSA can become in your photographic life.

Mail your prints to: Picture of the Month, The Photographic Society of America, 2005 Walnut Street, Philadelphia 3, Pa.

OUR INSERT

The collotype insert on the opposite page, printed by the Tricorn Press of New York City, was taken by PSA's good friend, Victor Keppler.

Some time ago we asked Mr. Keppler to let us reproduce his favorite picture—the one he liked best. He chose this appealing shot of a pup caught in the act.

Our sincere appreciation goes to W. Dovel LeSage, APSA, and Miss Doris Martha Weber, APSA, for their help in obtaining and editing the articles in this Pictorial Feature.

THE EDITOR.

Pictorial DIGEST Division

Devoted to News of the Pictorial Division of the Photographic Society of America

WHAT ARE YOU DOING?

During the past year I have had the pleasure of studying design with a fine artist on the faculty of our Columbus Art School. While his work is done primarily in the various "art" media, he is a firm believer in the fact that great art can be created with a camera as well as by other means.

One of the things which he continually emphasizes in our classes is the importance of learning by doing. Of the importance of solving a problem to the best of your ability, of analyzing and criticizing your solution—and then doing it again to find a better solution.

Yes, any of us can talk for hours on end about how pictures can be made better, especially pictures made by others, pictures in which we have no emotional interest. But can we po better ourselves? Ah, that is the crux of the matter. Only when we have set ourselves a problem, and worked out more than one or two solutions, can we know how pictures can be made better.

But you are plagued by TIME, you say, you can never find enough of it. So it is with most of us. How can we improve our pictures in the time we have to spend?

Well, we could carry our cameras with us all of the time, and when we see an interesting picture, we can stop and take it. But that isn't always convenient (Can you imagine some of our petite women photographers going to lunch with a 4x5 Graphic in their hands?), and negatives have to be developed and printed, too.

How then can we hope to utilize our odd moments of extra time to improve our pictures? By being picture conscious everywhere we go, by looking critically at everything we see. By looking at ALL things as if we were looking through the viewfinders of our cameras.

What is the center of interest, and how can we make it stand out in our finished picture? What would be the most effective angle to shoot from? Is our subject lighted in the best possible manner? How much should be included in our finished picture?

Watch your subject as you walk along the street. Study the differences which a change of viewing angle bring. Think of what you want to convey to your viewers. How can you best portray your subject to let your viewers see what you see and how you feel about it.

Look for pictures everywhere you go. Think pictures during your odd moments every day. Take pictures every opportunity you get.

For only by making pictures, thinking pictures, and looking for pictures all of the time can you develop an approach to photography which will make your pictures better all the time.

STELLA JENKS

International Portfolios

STANLEY D. SOHL, Associate Editor

Somehow, human curiosity finds its greatest satisfaction in peeping at something that is out of the ordinary, hard to find, or just new. It is this desire to broaden one's outlook on life and on world affairs that makes the International Portfolios so very intriguing. Here, as with a certain kind of magic, we can sweep aside the international boundaries, the vast miles of space, the language differences, and come face to face with our photographic neighbors. Photography is a wonderful equalizer for it gives us an equal starting point on which we can build our own international understanding and point of tolerant interest.

One might say to himself that he is not ready to show his wares to an international neighbor in some foreign country. Yet any photographer who has developed his skill to a point where he is capable of making salon prints is ready for an International Portfolio. He has something of interest for them to see and to enjoy. If one has the ability for salon work, but for some reason does not exhibit, he too should feel welcome to join any of the portfolios. The International Portfolios give us a chance to "talk" to these friends, to learn of their ways and at the same time to spread international friendship that is almost invaluable in this day and age.

Dominican Republic's First Salon

Juan Ulises Garcia, General Secretary of the Dominican-American and Caribbean-American Portfolios, writes that he has been appointed to organize the first Dominican International Salon under the joint sponsorship of the Dominican Photographic Society and the Dominican American Institute of Culture where the salon will be exhibited.

According to present plans the First Dominican International Salon of Photography will open in Trujillo City on October 24, 1952, during the national celebration honoring the birthday of President Dr. Trujillo Molina, the United Nations celebration, and Flag Day. The outstanding prints are to be honored with substantial

Juan Garcia also writes that he is recovering nicely from his unfortunate automobile accident of several months ago and subsequent operations. He continues:

"It is of great interest for every member of these Caribbean Portfolios to know how our friends in the photographic art appreciate the efforts we make for a mutual understanding in the divine art of Daguerre! The importance of this event can be drawn from the urgent need of gathering all the peoples of the world who still love democracy, liberty, and international justice.

"Art is a great revelation of the part of God we have inside; and the human spirit, a skilled and wise searcher. Through emotion and aesthetics we can easily find the spirit of things, and those moments of tragic beauty and truth that, since the creation of the world, spread on our souls; we can create the dream of new world in which the horror of war is unknown. And I sincerely think that our portfolios, using photography as the purest and most illustrious and picturesque language, can describe with perfection the love and universal language of mankind.

"The mission of our International Portfolios is very important in the world of art."

To Juan Ulises Garcia Bonnelly we say, Amen! We also want to wish you and the First Dominican International Salon of Photography the best of luck in your adventures.

Royal Organizes Portfolios

According to a recent communication from Cecil J. Blay to Burton D. Holley, the Royal Photographic Society of Great Britain is in the process of forming photographic portfolio interchanges between Canada and Britain along the lines of the Anglo-American Portfolios which have been operating since 1944. The following is from a bulletin sent recently by the Royal Photographic Society to all of its members in Canada:

For many years past, under the able direction of Mr. Cecil J. Blay, FPSA, FRPS, in England and Mr. Burton D. Holley, Hon. PSA, APSA, in the United States, an exchange of photographs has been conducted between workers in the two countries, with such success that eight portfolios are now in regular circulation on each side of the Atlantic. This success has inspired the recent completion

This success has inspired the recent completion of arrangements for a similar circulation between British and Canadian photographers. Mr. A. S. A. Wooster, ARPS, of Sunny Braes, Booker Lane, High Wycombe, Bucs., England, and Mr. C. F. Dakin of 58 Pine Street, Nanaimo, British Columbia, Canada, are acting as the respective Secretaries. They are now engaged, in collecting work from ten contributors on each side and the exchange will then commence at the earliest possible moment.

The exchange will be organized on lines similar to those which have operated so well in connection with the Anglo-American Portfolios, except that it is not proposed to restrict membership to Fellows and Associates, as is the rule in the case of the Anglo-American exchange.

Philip B. Maples, Director 29 Spring Street, Brockport, New York A nominal annual subscription will be asked from each member of the portfolio in order to defray the cost of postage and incidental expenses. If the initial exchange is successful, more circles will be formed as required.

The Council has given its approval and support to the scheme, in the belief that it will help to foster and develop a fuller relationship between British and Canadian workers. The Council hopes that all Canadian Members will support the efforts of Mr. Dakin, who will be pleased to send full information to anyone who is interested in the project.

To the Royal Photographic Society wewish the best of success in your new venture of international photographic portfolios. It is especially gratifying to Cecil Blay and Burton Holley to see this fulfillment of the plans that were laid some four years ago for an Anglo-British Portfolio, acting on a suggestion made in 1947 by J. W. Campbell of Port Royal, Quebec. Preliminary arrangements were made at that time with the assistance of J. W. J. Underell of Montreal and Alec Pearlman of London.

Starting with this article we are planning to feature one of the general secretaries and their specific International Portfolio.

There are 16 different countries from which to choose and there are openings in almost every portfolio. Each is under the guidance of a general secretary who is responsible for its routing, he ships and receives it from the foreign country and where necessary he translates the comments into English.

To receive particulars on any specific portfolio or to join this international group of friends, just send your name, address and a short review of your photographic experience to Col. Charles J. Perry, Director of the International Portfolios, 7431 Ryan Road, El Paso, Texas.

Caribbean Portfolios

Organization of the Second Caribbean-American Portfolio Circle has been practically completed by the General Secre-

PSA International Portfolios

There are openings in the following PSA International Portfolios for Pictorial Division members who are interested in interchanging prints for comment and analysis with the leading photographers in foreign countries:

Anglo-American Canadian-American India-American Australasian-American Cuban-American French-American Swedish-American South African-Americ Brazilian-American Belgian-American Chinese-American Netherlands-American Dominican-American International Medical Portfolios Costa Rican-American Carribbean-American Mexican-American International Control Process Portfelio

For information, write to the Director of PSA International Portfolios, Col. Charles J. Perry, 7431 Ryan Road, El Paso, Texas.

taries of the six Caribbean and Central American member countries and the folio will soon start on its circuit of Cuba, Dominican Republic, Costa Rica, Nicaragua, Mexico, and United States.

Unlike the First Caribbean-American Circle in which comments and print criticisms are written in either English or Spanish, whichever is most convenient, the Second Circle will be entirely "Spanish speaking" with all comments and writing in the Spanish language. Membership of the Second Caribbean will be as follows:

United States

MISS EVELYN ROBBINS, Associate Editor

All of us who are members of portfolio circles receive cards notifying us far in advance when the portfolio will reach usif it arrives on schedule.

I have just heard of one portfolio member who has started something which I think might keep portfolios a bit closer to schedule. This person waits until the date that one of his portfolios is due. If it doesn't arrive, he writes a letter to the member of the circle immediately ahead of him. and asks him if he has the portfolio, and if so, when it can be expected. He also suggests to this person that if he hasn't yet received the portfolio, it might be a good idea for him to write to the person from whom he should have received the portfolio.

With a little cooperation, this idea should help our be-deviled portfolio secretaries. and it should materially help to mitigate the greatest evil in the whole portfolio activity: The selfish holding up of portfolios by some indifferent or lackadaisical member of the circle, who spoils everyone's fun by not doing his job properly.

Eldie, at the top of the activity, and each circle secretary, are doing everything possible to keep the portfolios moving on time, but each of us who belong to portfolios can apply a little more pressure on the recalcitrant members by giving them a personal and indignant "How Come?" the demand going back along the line until it hits the guilty member of the circle.

Speaking of slowing up the portfolio circles, the worst trouble maker we have is the vacation season. All of us have sense enough to notify the milk man and the paper boy when we leave on a vacation, and if we have sense enough to do that, we should have sense enough and be thoughtful enough, to likewise notify our circle secretaries that we are going to be gone a certain two or three weeks.

If notified in time, it will be a simple matter for the circle secretary to reroute the portfolio, so that it will come either before or after the vacation period.

It is perfectly obvious that if two or three members of the circle permit their portfolio to arrive while they are on vacation, the portfolio will get months behind. and make only one or one and a half circuits in a year, instead of the three circuits that are quite possible if everyone-including the Commentator-will cooperate.

Take In a Salon Judging

I have attended all PSA Conventions since Cincinnati, and at each Convention I have talked to as many salonists as possible. All in all, I think it is safe to say that I have talked to scores of men and women who are prominent and successful in pictorial photography, and without exception, they have all suggested that the best way to learn what makes a good picture is to attend the judging of an international salon.

There is no reason to be shy about this; you will find that all salon committees are delighted to have outside guests attend their judgings, and out-of-towners are almost invariably treated as honored guests. At least that has been my experience, and I have attended a good many judgings.

Almost all the photography magazines carry schedules of international salons. Watch these lists, and pick out a salon sponsored by some organization reasonably near your home town. Write to the chairman of the salon committee, whose name will be given in these listings, and ask him when and where the judging will be held; usually, the judging will take place within a week or two from the time given as the closing date. Even if you have to drive two or three hundred miles each way to attend the judging, you will find that your investment in time and money will be a mighty fine investment, if you are really interested in pictorial photography.

For one thing, you will meet a lot of camera club people who are interested in salon photography; if they aren't, they wouldn't be putting on a salon. Also, you will have an opportunity to talk to the judges and it goes without saying that the men and women who judge international salons are people who may be depended upon for sound counsel.

If you are a beginner, you will probably hold the judges in considerable awe; I know that that was my attitude when I first became interested in pictorial photography. However, salon judges are not, not ever, august untouchables. They are exceedingly friendly men and women who really delight in rendering a helping hand, and even a casual contact with them might well become the turning point in your career as a pictorial photographer.

By all means, when you write to the chairman of the salon you plan on visiting, ask him for an entry blank, and send your four best prints to the salon. You may be surprised and delighted to get an acceptance or two, but even if all four of them go down, it is quite likely that there will be discussion which will inform you regarding the good and the bad points of your prints.

Even if there is no discussion, your own mental comparison between your prints and the prints which are accepted will be more enlightening than a million words of general comment and instruction.

Observe attentively the prints that are accepted unanimously, the first time through: the honor prints. From these prints you will learn a great deal about

pictorialism, and also about that indefinable something which is called "print quality".

Compare these prints with the prints which are merely held, and which may go in or out on the second viewing.

Note carefully the kind of prints that go out instantly and enthusiastically the first time through. These are the bad prints, the hopeless prints. Compare them with the honor prints, and before the judging is over you will be able to recognize, instantly, a good print from a bad print, and when you go home, you will be able to look for good pictures, and find good pictures. Also, you will know what must be done in the darkroom to produce the kind of prints that judges like to see, and that go "In!" the first time through.

This isn't all just fine spun theory. I, personally, have gone three or four hundred miles to attend the judging, and invariably, I have found my time and money well spent. Judgings are almost invariably held on Saturdays, so it is not necessary that you lay off to attend. About the only thing that is necessary is that you make up your mind, definitely, to see for yourself what it is all about by attending an international salon judging!

Ask Your Commentator

This is an idea that won't work out with all commentators but it will work with a good many of them.

If you are really desirous of making more good pictures, write to your commentator and tell him frankly what your troubles are, and ask him if he will give you some special help, if you will send prints direct to him. Assure him that any and all suggestions given will be followed, and that after the picture has been remade. as suggested, it will be re-submitted to him.

Assure him, also, that you have got a tough hide, and that if he says the best treatment for the picture is to destroy the negative and forget all about it your feelings won't be hurt.

Commentators are busy people, of course. but until you have known a few commentators personally, and have come to sense the feeling they have for the members of their portfolios, you will never fully appreciate how personally interested they are in your success, and how generously they will give of their time to help a really sincere and enthusiastic worker to turn out A-I stuff.

They wouldn't be commentators if they didn't feel that way about their jobs!

Reward for Promptness

ELDRIDGE R. CHRISTHILF, HON. PSA, APSA

During the portfolio meeting at the Detroit Convention, a furor was created by the showing of two volumes of salon prints which John Hogan had prepared. They showed and explained in detail all the steps taken from making the original contact print to the finished salon print. These books are loose-leaf, and are beautifully illustrated with photographs and with diagrams-hand-made, not printed-and represent a full year's work by John Hogan.

The immediate response was that every

circle secretary and portfolio member present wanted the books to travel their respective circles. These books were made with the primary objective of travelling the circles and bringing to each member complete and easy to understand directions of darkroom controls necessary for better pictorialism. Those who were fortunate enough to examine and study the books realize the immense amount of work behind their preparation and their value to the serious photographer.

John made the books available with the understanding that they would be confined to the Pictorial Portfolios and further, in order to have the book circulate to its members, the portfolio must complete its circuit AHEAD of schedule—thus promptness will bring its reward.

The first portfolio circle to have the privilege of viewing Volume I of these Pictorial Instruction Books will be Circle #30, under the guidance of Circle Secretary William B. Reeves, of Dallas, Texas. Congratulations to Bill Reeves and to the members of Pictorial Portfolio #30 for carning the right to study this volume of control methods. We know that from now on better prints in Circle #30 will be the rule rather than the exception.

The Hogan Books will not accompany the portfolios, but will travel separately between rounds. There is no reason why other circles cannot follow the lead of Circle #30 and bring their portfolios in ahead of schedule. It can be done, if each member will cooperate.

A. LYNNE PASCHALL, Associate Editor

Are You Positive?

Chinese philosophers believe that the universe is made up of two opposing forces, a positive and a negative you might say, and everything is a compromise between them. In support of such a theory they can point to the pages of history, where it is painfully evident that every movement of mankind, whether political, religious, or economic has met determined opposition from a party advocating the contrary.

The field of art has been no exception to this story, and recently photography has come in for its share of dissention. There are two schools. The one believes in choosing subjects that are real and tangible, and so portraying them that the viewer catches some of the inspiration that led the photographer to record them. The other school, under various names such as "modernist," "abstractionist," "surrealist," or what have you, has adopted originality as its slogan and under that standard ridicules any attempt to record nature on the grounds that it has been done before.

AN INVITATION

This is an invitation to every PSA member to participate in the PSA American Portfolios.

Enrollments are now being received in the following specialized groups:

PSA Pictorial Portfolios
PSA Portrait Portfolios
PSA Miniature Portfolios
PSA Control Process Portfolios
PSA Star Exhibitor Portfolios
(For PSA Award of Merit Winners)
PSA Nature Portfolios
PSA Photo-Journalism Portfolios

For information concerning any of the foregoing activities and for enrollment blanks, write to the Director of the PSA American Portfolios, Eldridge R. Christhilf, Hon. PSA, APSA, Suite 406, 800 Davis Street, Evanston, Illinois.

Naturally, there can be no reconciliation between the two extremes. Like East and West, "... never the twain shall meet."

Your editor recently received a copy of a camera club's monthly bulletin which contained an editorial from which we quote the following paragraph.

There is need for club programming along newer lines. Anything that has been done should be ruled out. Camera club programming is really quite stale and there is much room for a bit of the dramatic and showmanship that is frank and honest. Television and other mediums are real competition today, because the Camera Club Program Committees are not up to date. There should be lectures on the more practical usages of color through painters, interior decorators, color chemists, and even psychologists. Camera clubs should touch upon as many facets of art as possible through less direct lectures. As one example, have a bridge builder tell us how he builds a bridge. This is knowledge, and knowledge is perception and art. Art is education. One communicates best who is educated the best in perceptions.

We do not know what your reactions are to that kind of doctrine, and frankly, we don't care. All roads lead to Rome for us, and that leads us back to the job for which this column exists. That is, to assist the bewildered members of program committees by persistently calling their attention to the program material that has been provided by PSA for the use of its member clubs.

Whichever way your views on art lean, you are likely to find something interesting in the varied material that is listed.

American Exhibits

Take the American Exhibits for example. I have not seen them all personally so I suggest when writing to Fred Fix, Jr., that you tell him just what style of pictures you are seeking. If you want fresh ideas from a hitherto little explored field, perhaps he will recommend the Standard Oil shows.

Fred tells me that his newest show is a group of 35 pictures by Southern California photographers. Included are a number of superb seascapes by Charles Wilson, of San Diego, a master at this kind of work. Most of the pictures in this exhibit have had excellent salon records and have frequently been reproduced in catalogs and magazines.

Camera Club Print Circuits

Here again, is a chance to air your own preferences. There are no restrictions on subject matter or treatment, so if your club goes in for pattern shots or abstractions pick out three of the best ones and enter a print circuit. On the other hand, if your club is of the conservative type and likes cows browsing under blooming apple trees, put in that kind and you will find plenty of support.

William Hutchinson always has a circuit in the making, so ask him for a blank and get in the application promptly.

Judging Service

This work is now carried on by Fred Bauer, Jr., and as he is a new man to this column, we'll have to tell you about him.

Mr. Bauer was born in St. Louis, but his family moved to Memphis when he was a small boy, and he attended the public schools of that city. He also carned the degree of PhB at the University of Notre Dame. He is now Secretary and Treasurer of Bauer's Inc. of Memphis, a firm that deals in automobile, truck, and tractor parts.

On the side, he manages to find time for some photography. He says he began puttering with pictures while in college but did not get serious about it until he joined the Memphis Pictorialists in 1944.

A year later, he was persuaded to send prints to a salon, and had three accepted the first time. Of course, that record was too good to last and it was a year before it happened again, but he is now sending to about 15 exhibitions a year and the acceptances average two or three per salon.

Mr. Bauer is married and has three daughters and a son. He admits that he has his best luck with pictures of the family

In addition to the job of making a living for this up-and-coming family, and looking after a lot of civic and charity work, he still retains an interest in the hobby and says: "I'll always find enough time to keep active in print-making, and I am happy for the opportunity to serve PSA in this print-judging service capacity. I am sincere in my hope that the camera clubs throughout the country will take advantage of the Print Judging Service."

Any club wishing to have a print competition judged, should send a request to Fred Bauer, Jr., 383 Monroe St., Memphis, Tenn. He will immediately put that club in contact with one, two, or more judges in its own vicinity, who will perform the service promptly. Whenever possible, judging will be done as the camera club requests. For instance, if for the purpose of a particular contest the camera club specifies that a First, Second, and Third place, with six Honorable Mentions be selected, the judges will be pleased to comply.

Portfolio of Portfolios

We have just received a letter from Dennis Anderson saying that he is turning over this activity to Mr. James T. Johnson, 725 W. Sola St., Santa Barbara, California.

Set No. 1 was in the hands of the Baton Rouge Camera Club in February, and Set No. 2 is scheduled for the same club on April 28th.

Portfolian Clubs

The Lincoln, Nebraska, Club has a salon in circulation which in due time will reach all of the Portfolians. That is a nice thing for any club to do. You create a lot of interest and have a lot of fun in your own club getting the exhibition ready, and then maybe you will get some exchange shows from other clubs, and each one of them will take care of the program for a meeting.

GEORGE GREEN, Associate Editor

Award of Merit

New 1-Star Exhibitor DeWitt Bishop Sacramento, Cal. Advanced From 1-Star to 2-Star Robert V. George Towson, Maryland Advanced From 2-Star to 3-Star C. A. Yarrington New York, N. Y. Advanced From 3-Star to 4-Star Theodore L. Bronson New York, N. Y.

Are you a recipient of the PSA Award of Merit? If you aren't and have had prints accepted in international pictorial exhibitions, you should investigate this method of getting more acclaim and honor for your photographic endeavors.

Further information may be obtained from the Director whose name and address is listed in the masthead of the Digest.

Pen Pals

Would you like to know how the people on the other side of the fence live? How much greener it is than on your side? What their thinking consists of and what their reactions are to the same problems which confronts you?

I know that "Ham" radio set owners have felt that urge. That is prehably why they purchased an amateur short wave set ... just to be able to make contacts and friends with people they never met face to face and probably never would.

You members of the PSA can have as much fun as the "Ham" radio operator. As a matter of fact you can have a much better time because you can not only mull over the various phases of present day living but can also exchange photographs. That way, your world and the pen-pals will be graphically etched upon your mind.

Another aspect is that people in different countries or places see the same scene in a different light and therefore their interpretation is different. When exchanging prints and discussing them via mail you learn how to improve your own photographic efforts.

Be a Pen-Pol to another PSAer. Contact Miss Frances A. Hajicek, Director, 7107 South Bennett, Chicago 49, Illinois.

What's It to You!!!

The colloquialism, "What's it to you" is to man what a red waving flag is to a bull. Them thar are fightin' words 'cause the modern American interpretation boils down to a "Well, what are you going to do about it?" It's a put-up or shut-up which can be applied quite adequately to you who are puttering your way along the course of pictorial excellence.

And, just like golf, you need more than the equipment to make your score prove your proficiency. You've got to have know-how! Once that is tucked away in your mind for easy reference then all you have to do is apply it at the right moment and in the correct manner. Practically everything you do during the day and night which requires a modicum of thinking is performed either automatically or by direction. In order to accomplish this action the mind reacts to the chore or problem by calling upon its storeroom of previous knowledge and/or experience.

Now, I'm not going to set forth any psychological treatise, so don't become alarmed. I'm just warming-up to the core of the subject: "What are you going to do about it?" About what? Why, about you and your camera and your darkroom processes!

Every negative, except a complete dud, has a center of interest. Something in the scene (picture area) must have either one or a group of objects which attract the

viewer's eyes. This is attained by having the object(s) transmit its importance immediately to the viewer-by catching the eye's attention and holding onto it until it has conveyed the photographer's thoughts and/or impressions to the person viewing

the print.

We're well aware of the fact that every so often a gremlin inside the camera pushes the light rays around in such a manner that the finished product never looks like what the photographer saw before he made the exposure. But these phenomena should not occur too often. In the meantime it might be of future value if we look into this idea of having our pictures tell the story, instead of us doing it verbally as an aid to the photographer.

Emphasis is obtained in many ways. It behooves the camerist to learn what emphasis is. You can read all the books ever published but you'll never learn unless you begin by analyzing the pictures your eyes gaze upon during the day. Stop and ask yourself what there was in the photo which made you either like or dislike it. Try to determine what the causes were for your own specific action . . . and then remember them. And, you can bet your last dollar that whatever there was in the print which caught your attention it was not done with mirrors but with emphasis.

Actually it is the adroit and excellent handling of lines, form and space. Placing them together or separately in the picture area in such a manner that the eye automatically, must follow into the center of interest. This is accomplished by knowing how to analyze a scene and seeing what you are looking at, reproducing it within your mind prior to making the exposure.

It might call upon you to use two negatives to produce one outstanding print. It definitely will require a working knowledge and understanding of composition because very few negatives are printed or enlarged "as is" for salon or club competition. By cropping you can eliminate the unwanted objects during enlargement. By tilting the easel and manipulating the enlarger you can obtain the various effects so important in bringing a print out of the depth of mediocrity into the sunlight of acclaim.

You, as a member of the Pictorial Division, can obtain an expert's opinion on your photographic work. It is free. All you have to do is send a contact print plus an 8 x 10 enlargement of one of your photographs to J. Elwood Armstrong, Director of Personalized Print Analysis. Follow the directions outlined in the January issue of PSA JOURNAL.

PSA Recorded Lecture Program

The Recorded Lecture Program of the Pictorial Division offers the following programs for your club.

No. 1. An Analysis of Recognized Salon Prints by Ragnar Hedenvall, APSA

No. 2. Commentary on Recognized Salon Prints by Morris Gurrie No. 3. Outdoor Photography by D. Ward Pease, FPSA

No. 4. Still Life by Ann Pilger Dewey, APSA, Hon. PSA.

No. 5. New Prints for Old by Barbara Green, APSA

SPECIAL Photography of the Nude by P. H. Oelman, FPSA

A deposit of \$25.00 should accompany an order. A service charge is made for each Lecture. The SPECIAL costs \$10.00 and should be ordered directly from Mr. Oelman. For clubs which are members of PSA but are not affiliated with the PD the charge is \$6.50. Clubs which are affiliated with the PD will be charged \$5.00. Clubs or groups not members of PSA will be quoted prices on request to the Director.

For Nos. 1 to 5 order from Philip B. Maples, Director, Recorded Lecture Program, 29 Spring Street, Brockport, New York.

For the SPECIAL please contact: P. H. Oelman, FPSA, 2505 Moorman Avenue, Cincinnati 6, Obio.

INTERNATIONAL CLUB PRINT COMPETITION

ROBERT J. LAUER, Associate Editor

The camera clubs participating in this month's competition will receive for the first time this season a judge's ballot, showing how their prints scored in this bimonthly contest. Instituted by members of the Owego Camera Club (Owego, N. Y.) who are sponsoring the April judging, the ballot will be divided into three categories: interest, composition, and technique. The judges will rate each entry as good, fair or poor. A score will be given by each of the three judges based on a maximum of ten points from each judge, on each of the four prints a club is allowed to submit.

This ballot is meant to serve in place of the judges' comments which, in previous years, had been written on the back of each club's entry form. Present deadline dates make it almost impossible to do justice with detailed comments on each print submitted. Although judges are always most anxious to comment freely, the transcription work involved generally takes several days, thus holding up copy which must go to press right after judging. For individuals wishing a complete analysis of their prints, the Personalized Print Analysis Service of the Pictorial Division gives complete and helpful information presented by experts.

Listed below is the complete standing of all participating camera clubs as of December. Next month will bring the results of the February competition held at Rochester, N. Y., under the direction of Kodak Camera Club.

There is only one more contest to go after April. Plans are already being made for next fall, when a new contest season gets under way. Why not encourage your club to be represented next October? This is the only competition of its kind designed expressly for camera clubs and the oldest in the world. It's competitive, it's fun. You can start out with clubs in your own class, whether just beginning or far advanced. And it's rewarding too, with Honorable Mention stickers, silver medals for individual winners, and trophics for the clubs with the highest scores. For information, write to Robert J. Lauer, Director, 807 S. 14th Street, Milwaukee 4, Wisconsin.

Club scores as of December are as

WALTER E. PARKER, Associate Editor

As the knowledge of the International Exhibits spreads, increasing interest among our foreign friends is developing.

I have before me a letter from a foreign member of PSA asking for a collection of American prints which he and his friends can use to improve their technique in print making. Another member of PSA living in the Panama Canal Zone has received some of our foreign exhibits and he writes how welcome they are to countries which are not so fortunate in having closer contacts with us in the USA.

This is the way we encourage good fellowship through the International Exhibits. Sometimes we seem to sit back and say "let George do it," but there do not seem to be enough Georges to go around.

There is room for a show from your club. If collecting a show of 25 or 50 prints is too much for one club, get one or two other clubs in your own town or district to join you and make up a combined show for exchange with a foreign country.

If your club would like to see or display one of the International Exhibits now in the United States, write the Director for a list of the shows available. There are changes from time to time as foreign shows are returned, but as more American groups join the friendship parade, the number of International Exhibits grows.

Coming Salons Agreeing to Follow PSA Recommendations

Note: M-monochrome prints, C-color prints, T-color transparencies, SS-stereo slides, L-monochrome slides, A-architectural prints, S-scientific or nature

prints. Entry fee is \$1.00 in each class unle otherwise specified. Recognition: The mono-chrome portions of salons listed have Pictorial Division approval. Check salon list of appropriate

Division approval. Check saion list of appropriate division for recognition of other sections.

Seatile (M) Exhibited Apr. 9-May 4 at Art Museum. Data: Arthur Henning, 4516 E. 60th St., Seattle S, Wash.

Louisville (M,T) Exhibited Apr. 26-May 14 at Speed Art Museum. Data: Ernest T. Humphang 4722 Euckley Am. Taskeding 12 Speed Art Museum. Data: Etwee ... Humphrey, 4722 Burkley Ave., Louisville 18,

Bergen County (M,T) Exhibited Apr. 13 to May 4 at Young Men's Hebrew Assn. Data: Chas. Kuydendall, 51 Highwood Drive, Dumont,

N. J.
Toronto (M,C) Exhibited Apr. 29-May 10 at Avon Galleries. Data: Rex Frost, 37 Bloor Street West, Toronto 5, Ontario, Canada.

Amsterdam (M.T) Closes May 15. Exhibited June 27-July 6 at Foto and Film Festival. Data: Secretary, Zulder Stationsweg 33,

PSA COLOR DIVISION

- George F. Johnson, APSA .

Forestry Building, State College, Penna.

A program with dozens of outstanding color features is being arranged for the PSA Convention in New York City, August 13-16, according to Paul J. Wolf, APSA, Color Chairman.

Among the features now scheduled are illustrated lectures by John Doscher, FPSA, on Dye Transfer work in color prints and Helen C. Manzer, APSA, on "Ins and Outs of the Color Shows." Mrs. Manzer will illustrate her talk with many of her slides which have given her eighth place in the all-time "Who's Who in Color Slide Photography."

Dr. Richard B. Pomeroy will take color enthusiasts on a "trip" entitled "Sword-fishing Out of Gloucester," an adventure story in color slides. William A. Price will show us "Rural Life in Japan" with "The Eruption of Mt. Mihara," made during his four-year stay in that country. Mr. Price is a past president of the Circle of Confusion CC of Tokyo.

Amy and John Walker will give a talk on "Modern Art and Color Photography," an exposition of what is behind modern art and how it can be adapted for color work. Charles A. Kinsley, APSA, will provide a program on Color Filters and Jay T. Fox, APSA, FBPA, will show a 16mm film in color on Photomicrography and Photomacrography entitled "Nature's Highlights." Mr. Fox is one of the experts in this field; his film received a Special Award from the Biological Photographers Association this year.

A. C. Klein, APSA, will again handle the Color Slide Critique that was such a popular part of the Detroit program. The Color Division will hold a luncheon, this time under the guidance and arrangements of Mr. and Mrs. Robert J. Goldman, of the New York Color Slide Club. There will be at least two showings of the International Color Slide Exhibit, for which Mrs. Amy M. Walker is chairman.

Judges for the Color section of the 1952 PSA International will be: Joseph Breitenbach, ARPS, well-known professional and teacher of photography, lecturer and judge; Harry Haimes, APSA, leading exhibitor, speaker and judge; Frank E. Fenner, FPSA, Editor of *Photography* Magazine.

Thanks From Tokyo

Through the kindness of the American Red Cross in Tokyo, we are able to quote a letter of thanks written by the Red Cross recreation workers at the Tokyo U. S. Army Hospital to the chairman of the Red Cross Volunteer Services in that city. We quote:

Through this channel we wish to express to Mr. Baumgaertal and his friends in the Photographic Society of America the sincere thanks of the patients at Tokyo Army Hospital for the very lovely color slides they contributed. These photographs

have been used many times and each time they have been thoroughly enjoyed.

Recently they were used for a discussion group between the United Nations patients and the Japanese University students. The parks and scenery of the United States became very real through your lovely Kodachrome slides. These views provoked much discussion from people of other nations and soon international scenery was discussed.

A group of patients and a Red Cross worker recently sat down just to look at America through your slides. One patient saw New England streams in which he has fished. The meeting could have gone on for hours if time had permitted. "This is the best time that I have had since I have been over here," sighed the 19 year old soldier as the group put away the pictures and machine. "When can we see them again?"

These are some of the indications of the pleasure that this generosity has brought to the patients away from home. We wish it were possible to thank each one personally for his interest in the patients' recreation program. Very often we stop to look again at home through these beautiful pictures.

With variations the story above can be considered as being constantly repeated in at least five other U. S. Army or Navy Hospitals in Japan, in at least eight United Nations Hospitals in Korea and in more than twenty U. S. Army, Navy and Veterans Hospitals in this country. In addition to their entertainment and educational phases, color slides are in many instances doing valuable therapeutic work, especially in connection with the rehabilitation of mental patients.

At present we are distributing between five and six thousand slides a month to the hospitals. Many more slides are needed not only to supply the hospitals now receiving service but also to permit service being extended to hospitals not now being served. Any slides that can be projected or viewed in hand viewers can be used except strictly family snapshots and nudes. Whenever possible slides should carry some simple identification of the locale or subject matter. Unidentified slides can be used but slides bearing the identification are much more valuable and of far greater interest. All slides are donated outright to the hospitals and none will be returned. Any slides you may care to contribute should be sent to Karl A. Baumgaertel, 353 - 31st Avenue, San Francisco, California.

Shooting Glassware

Several years ago glassware studies were something of a drug on the exhibition market, with the result that many well-arranged and skillfully planned stemware pictures were getting the red light from surfeited judges. In recent exhibitions, however, few good glass studies have been entered; these have been favorably received, and have often been among the prize winners.

Shooting glass in color is a type of photography in which successful results can

be secured by using reasonably good taste, plus half a dozen fairly precise rules:

- (1) For backgrounds, colored show-card stock (preferably 20x36 or somewhat larger) is cheapest and most adaptable. A selection of cards in both pastel and deeper solid hues will produce an almost endless series of colored backgrounds, by varying the intensity of the lighting. The colored backdrop should be hung or placed at least 12 inches behind the glassware set-up.
- (2) For the base, any table or similar flat surface is satisfactory. Since the base will form a rather dark, solid foundation for the picture, it is not lighted directly—but will pick up a little light reflected off the background. Set up the glassware close to the back edge of the base—in fact, almost hanging over the edge.
- (3) Use a low camera angle to avoid getting too much of the base into the picture. Generally speaking, not more than one-eighth of the picture area should be
- (4) Place the main light (a #2 Photoflood is good) under the table, directed up and back onto the background. Adjust the direction and distance of the main light until the illumination is nicely centered, with an even falling-off toward the edges. For pictorial purposes, glassware is generally best handled by reflected light.
- (5) Take the meter reading directly off the background from a distance of about six inches. Take a center reading, then a reading near the edges; use a compromise exposure about halfway between the
- (6) If several pieces of glassware are being used, arrange them with overlaps to tie the whole composition together. Avoid definitely separated elements, as this will tend to produce the feeling of several distinct pictures.
- (7) A narrow-beam spotlight may, if desired, be placed at one side to pick out the rims of the glassware. If this is done, keep the spotlight off the base and also avoid an angle which will throw shadows on the background—unless such shadows are planned as part of the picture.

Using these simple rules, hundreds of patterns can be developed with elegant stemware, sturdier goblets, glass plates, brandy snifters, even chemical and industrial glassware like retorts, volumetric flasks, and the like. For further variations, try masking the main light with colored cellophane; partly filling glasses with clear, colored liquids (water colors are ideal to whip up any desired tint); and projecting patterns, clouds, etc., on the background. And for a bubbly effect, try filling a wineglass with a highly carbonated ginger ale (or even champagne, if you're in the champagne bracket).

True, much different set-ups are used by commercial photographers in shooting stemware, but remember—they're trying to sell the glassware, while you're trying to sell the picture!—H. G. MITCHELL

New CD Librarian

Donald B. Grim, Building 26, Kodak Park, Rochester 4, New York, has been named CD Librarian succeeding Harry Haimes, APSA, New York, who has asked to be relieved of the work because of the pressure of business responsibilities.

Mr. Grim will be in charge of the Color Division Library. This library consists of photographic publications such as foreign annuals and outstanding books which are of interest to many members but which do not normally justify the expense of sole ownership. These library items are routed to any Color Division member who requests them with the only expense being that of postage to the next person on the list. Additions to the Library are announced from time to time in the CD Bulletin. For full information, contact Mr. Grim.

Color Technique Tips

Users of Type "A" Kodachrome would do well to try the following combination for better color quality and more uniform exposure: Type "A" Kodachrome with 3200° Kelvin lamps using Kodak No. 82A filter.

The G. E. 3200° K. lamps, shaped like a No. 2 Photoflood, having a 30 hour life and costing about 80¢, are available, as is also a Sylvania 3200° K Reflector lamp.

Although Kodachrome Type "A" is balanced for use with Photoflood lamps, they have several disadvantages. During the short life of a Photoflood there is a considerable change in the color of the light emitted and in its quality. At the beginning of the life of a Photoflood the light is too blue and when the lamp has burned for little over one half of its useful life the light is too red. This can and does lead to unpredictable results and off-color skin tones especially.

The 3200° K lamps have very little change in color quality during their life leading to more uniform results and better color generally.

Ansco Color tungsten, Ektachrome type "B" and Ektacolor type "B" may be used with the 3200° K lamps, one third (1/3) to one half (1/2) stop more exposure than for corresponding Photoflood lamps being necessary.-Norman Rothschild in New York Color Slide Club's Rainbow.

Coming Color Exhibitions

El Camino, April 29-May 20, deadline Apr. 12.
Four slides (up to 234), \$1. Forms: George E.
French, 3877 Olmsted, Los Angeles 8, Calif.
Southgate (England), May 17-31, deadline April
23. Four slides (up to 234), \$1. Forms: N. F.

Kember, 13, Ravenscraigh Rd., New Southgate, N. 11, London, England Reading, June 11-13, deadline May 19. Four slides, \$1. Forms: Norman Weber, 550 N. 11th

St., Reading, Pa.

**St., Reading, 12.

**St., Re

Av., Memphis 3, Tenn.

Hartford, July 2-20, deadline June 17. Four alides, \$1. Forms: R. J. LeBlanc, 234 S. Quaker Lane, West Hartford, Conn.

PSA (New York), August 13-21, deadline July 10.

Four slides or prints. Entry fee \$1. Forms: Paul Wolf, 354 Ft. Washington, Hawthorne, N. Y.

of Science, Buffalo, New York. For entry forms or information write Irene Langendorfer, 419 Riley St., Buffalo 8, N. Y. Closing Date is April 23, 1952; judging date April 26, 1952.

Prints and slides will be forwarded to the PSA Exhibition in New York City if so directed.

April Nature Color Slide Contest

Entry forms for the April Nature Color Slide Contest were in the mail before March first and should have been in your hands in ample time for all nature folks to compete. This year's contests should be bigger and better than ever. Just in case you have forgotten get your slides in the mail

Nature Sequences Acceptable

Some months ago in this column the writer expressed the sentiments of several nature photographers anent the limitation of four prints and four slides in the American nature exhibitions. The general lament was that it was impossible to adequately tell the story of any of nature's great phenomena in a series of four prints or slides and that therefore their best efforts were effectively banned from competition.

While the writer was in sympathy with this viewpoint he hesitated in taking a definite stand in the matter and solicited comments on the subject from the nature workers and from the exhibitions themselves. Two of the American exhibitions took up the challenge immediately and invited the submission of sequences. These two were the Kentucky and Rochester shows. They have earned the gratitude of the nature worker, and, I might say, of the writer as well, for I feel that they have made him some friends among the nature photographers of the world.

The Kentucky exhibition, the first to take up the challenge and accept nature sequences, defends its position in the catalogue on page 16. For the benefit of the nature workers who failed to exhibit in this show, we feel it just and proper that we quote them here.

The Advent of the Sequence

"The exhibition of sequences seems to be an inevitable step in the progress of a nature photography show. In effect, any nature show is partly made up of incomplete and unorganized series in so far as this entrant has pictured one form, one variation, one stage of growth, one phase of activity, one seasonal change, or one life zone while that entrant has happened on another form, variation, stage, phase, change, or zone relating to the same sub-

"When an entrant achieves a logical combination of pictures he deserves a forum. The photographer who can plan beyond the one good shot, who can interpret the dynamics of nature, deserves additional recognition, and the cause of nature study deserves the chance for progress. The enthusiast who from his large collection can select pictures and shape and edit them into a sequence can also find additional satisfaction through competition in the sequence section. (Continued on page 286.)

PSA NATURE DIVISION

HARRY R. REICH, APSA

286 Schenck St., No. Tonawanda, New York

Edward H. Bourne, Chairman of the Nature Print Contests for 1952, announces that the January contest was conducted by the Kodak Camera Club of Rochester. N. Y. as a feature program of the nature section of the club at Kodak Park on January 23.

The judges, members of Kodak Camera Club, were H. Lou Gibson, FPSA, Dr. Henry C. Staehle, and Dr. Robert L. Roudabush, all experienced judges of nature exhibitions.

All entrants with one exception were members of the PSA Nature Division. The standard of quality of the submissions was exceptionally high, the judges expressing the opinion that more than the allotted eleven winners were worthy of awards of merit. The prints were judged on the basis of nine points for each judge, so that a total of twenty seven was possible. One print was awarded such a total and the lowest scoring print in the money was awarded twenty points indicating how extremely tight the competition was.

The results of the contest were as follows:

Medal Winners Maker Points **Mud Pattern** Otto Litzel New York City 25 Grant M. Haist Rochester, N. Y.

Consumed	U. of Texas Med- ical School	47
H. M. Ribbon	Maker	Points
Lying in Wait	T. S. Lal Quillon, India	24

F. W. Schmidt

Entry forms for the May Nature Print Contest will be in the mail on April first. Let's make this one really a stiff competition

Coming Nature Exhibitions

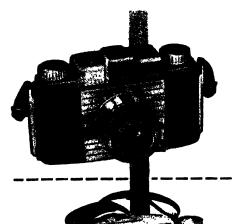

FOURTEENTH INTERNATIONAL EXHIBITION OF NATURE PHOTOG-RAPHY.

Sponsored by the Science Museum Photographic Club at the Buffalo Museum Spring's bursting out all over

It's Spring again...and here are Kodak cameras ready to help you make the most of every photographic moment...in both color and black-and-white. Get the camera that suits you best...and come on out!

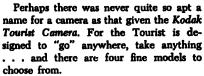

One of the handiest cameras to use outside—or anywhere—is a Kodak Pony Camera... the 135 or 828. The Pony will help you capture Spring's infinite color in beautiful transparencies perfect for giant projections or color prints and enlargements. Secret of each Pony's superbly crisp, clear shots is its Lumenized f/4.5 lens which focuses down to 2½ feet, and its velvet-smooth Kodak Flash 200 Shutter. This combination will give you unusually fine

pictures for a camera in this low, low price range. "Average" settings are marked in red to make picture taking easy. Light in weight, it's easy to carry anywhere. Easy to use, too... controls are so handy. The Kodak Pony 828 takes 8-exposure 828 film, including Kodacolor; costs \$31.15. The Kodak Pony 135 takes 20- or 36-exposure 135 film; has automatic film counter and stop; costs \$35.75. Either is an ideal second camera... an excellent color camera.

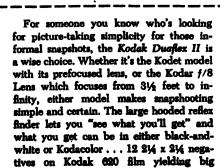

The finest Tourist ever made is the Kodak Tourist II with the Kodak Synchro-Rapid 800 Shutter. Here is ability to get action—and get it for keeps. Yet, it takes fine portraits as well. This between-the-lcns shutter has ten speeds; works with the 4-element Lumenized Kodak Anastar f/4.5 Lens (which focuses from 3½ feet to infinity).

All four Tourist models permit precise steadiness in taking because the shutter release is at your finger tip, in the edge of the camera bed. The f/4.5 models have a new Scopesight Finder for greater framing and composing accuracy, and accept the

accessory Kodak Service Range Finder. Whichever Tourist you choose, you get 21/4 x 31/4 negatives in black-and-white or Kodacolor. The f/4.5 models take an Adapter Kit which lets you get three more sizes, including No. 828 black-and-white and Kodachrome (28x40mm.), and halfsize 620 (15% x 21/4) permitting 16 negatives from an 8-exposure roll. (Incidentally, oversize prints are the same size as those from a 21/4 x 31/4 negative.) Still another mask gives you 21/4 x 21/4 negatives, 12 shots per roll. Tourists are priced at \$26.25 for the Kodet Lens model in the Flash Kodon Shutter; the Kodak Anaston f/6.3 Lens in Flash 200 Shutter at \$46.25; the Kodak Anaston f/4.5 Lumenized Lens in Flash Kodamatic Shutter at \$72.55 and the Lumenized Kodak Anastar f/4.5 Lens in the Kodak Synchro-Rapid 800 Shutter, \$97.40. Adapter Kit. \$13.25.

Another handy camera for tourists and "stay-at-homes" is the Kodak Flash Bantam f/4.5. It's so small it fits easily into a coat pocket. Yet it captures shots which lead to eye-filling Kodachrome screen projections, Kodachrome and Kodacolor prints, and excellent black-and-white enlargements. The

Bantam has a flash shutter with 4 speeds up to 1/200 second, and a Kodak Anastar f/4.5 Lumenized Lens focusing from 2½ feet to infinity. Finger-tip controls let you swing into action fast. Takes 8-exposure Kodak 828 film. Camera, \$56.00. Accessory flasholder, \$10.55.

3½ x 3½ prints. The Kodak Duaflex Flasholder fits either camera. Kodak Duaflex II, with Kodet lens, is priced at \$14.50. With Kodar lens, \$22.30. Carrying case, \$2.65.

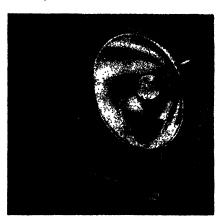

Prices in this Kodak Bulletin are list, including Federal Tax where applicable, and are subject to change without notice.

Kodak

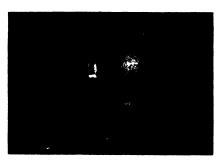

TRADITIONALLY, April means sun and showers . . . the start of spring . . . and things to do indoors and out. Let these Kodak accessories add pleasure to your April picture taking and picture showing.

Next to your camera, your lighting equipment means the most to you for indoor shooting. And if you haven't yet taken a look at the sensational Kedek Ektulux Flushelder, you've a treat in store . . . the

store being your Kodak dealer's, of course. For here is genuine professional equipment for the most advanced work, with a highenergy, battery-condenser-type flash unit scientifically designed for holding. The Flasholder plugs into your flash shutter. If you're using a press-type camera that doesn't have a flash shutter, you can use the Kodak Ektalux Synchro-Switch with a Kodak Ektalux Solenoid. Put two 221/2volt photoflash batteries in the Flasholder, and you can fire as many as seven lamps at one time (using Ektalux series-wired extension units). With one 221/2-volt battery, the Flasholder fires as many as three lamps. Ektalux extension units stand on any surface, fit a tripod, or accept Kodak Extension Unit Clamps which attach to any convenient object. Each extension unit comes with a 20-foot cord. Altogether, the most precise and versatile photoflash equipment you've ever seen. See this Ektalux Equipment soon ... at your Kodak dealer's. Flasholder prices start at \$29.75. Extension units, \$12.40 each.

To give your lighting equipment wellrounded versatility, the **Kedak Vari-Beam Lights** fill the bill. Both adjust for narrow,

medium-wide, or wide beams of light. Reflectors are big—12 inches wide—of anodized aluminum and accept No. 2 photofloods. The Standlight, with its tubular aluminum column, telescopes from 3 to 5½ feet in height, and is priced at \$16.00. The Clamplight has an adjustable locking bracket on a padded clamp to make it easy to attach to chair arms, etc. Price, \$10.50. Prices less lamps.

Raining or not, it's always time to have a Kodachrome "show," and this Kodaslide

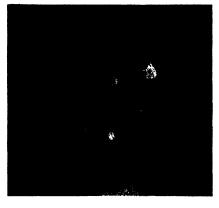

Projector 2A is the ticket—everyone's

"ticket"—to entertainment. Its optics are Lumenized, to give you greater color purity and more screen illumination. Images hit the screen big, sharp, brilliant. Two lenses are available. For average-size rooms, the superb Lumenized Kodak Projection Ektanon 5-inch f/3.5 Lens is the one you want. For larger-than-average rooms or lecture rooms, you can use the 7½-inch f/4 lens. The slide carrier works easily as does the lens barrel, which rotates for sharp focusing. Elevating is simple, too—a knob adjusts the 2A up to 10° above the horizontal. Comes with a 120-volt, 150-wait lamp

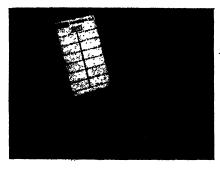

(other lamp voltages can be used). AC or DC. With 5-inch lens, \$52.80; with 7½-inch lens, \$63.45. Case, \$15.00.

If you're interested in quick showings of your color slides without interrupting someone's reading, you can do it nicely with the Kedesilde Table Viewer, 4X. Projector and screen are one compact unit.

You plug it in, insert your slides, get beautiful four-times-enlarged pictures on the Day-View Screen . . . in any lighted room. 3-element, Lumenized Kodak Projection Ektanon Lens, 50mm. f/3.5. Focusing control. AC-DC, 100-120V. \$49.50. Carrying case, \$15.50.

To hold your color slides in order, fully protected, the Kedaslide Compartment File

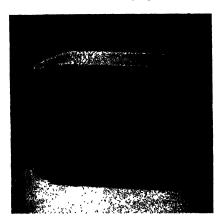

has 12 swing-out compartments for easy slide removal. Index on cover. Takes 240 cardboard or 96 glass slides. \$3.94. Kedeslide File Bex holds 140 cardboard or 55 glass slides. Separators for filing by subjects, Metal. \$1.57.

Indoors and Out

THESE Kodak accessories can add ease and facility to your outdoor picture taking... and some of them will help you bridge the photographic gap betwixt "good" and "superb."

One of the most helpful of outdoor accessories is a Kodak Carrying Case. Your

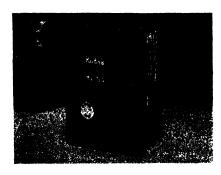

camera is protected from the elements. The shoulder strap makes your camera easy to carry, and it's always ready to use in a jiffy. Kodak Field Cases are expertly designed, made with the finest leather and workmanship . . . Duaflex models are of leatherlike plastic. Each field case has a tripod opening, too.

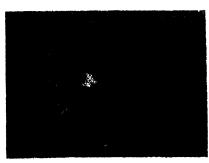

While you're on outings with other people, there are times when you'd like to get in the picture with them. The Kodek Auto-Release lets you do it, for it automatically trips your camera shutter about 10 seconds after it's set. Any camera with a cable release socket can use it. A spring clip holds the cable release firmly. \$3.86 (cable release not included).

Precise focusing is essential to good pictures. If your camers doesn't have a range finder, the Kedak Service Runge Pinder is very useful, especially for your close-up shots. It's a split-field, military-type range finder; you merely set it so that the split image seen through the eyeplece becomes a single image, and then read your correct focusing distance on the scale. Adjusts for subjects as near as two feet. Some cam-

eras, such as the Kodak Tourists, already have a range-finder bracket which permits easy attachment. Price, \$12.50—case included.

Still another photographic aid to have with you is the Kedak Master Photoguide. It's so compact it barely covers your hand, but it's packed full of photo data, with every computing device you need. You get tips on basic exposure, film data, flash guide numbers, as well as speedy dial calculators for daylight shots, flood, flash, field depth, and effective aperture. Field depth computing, moving subjects, close-ups... they're all covered, together with filter and Pola-Screen data, with a set of four contrast viewing filters to help you "preview" your shots. You shouldn't be without it, and the price is only \$1.75.

Whether you own a simple box camera or one "with everything," Kedek Wretten Filters can help you achieve individual pictorial expression. Your black-and-white scenics can be dramatized with rich dark skies... you can reduce atmospheric haze ... modify the black-and-white rendition of brightly colored subjects ... obtain better skin tones in portraits. You'll find a

new world of photographic enjoyment when you start using Kodak Wratten Filters.

For color work, especially, you'll want a **Redak Pele-Screen**. This polarizing filter often enables you to obtain a richer sky tone without materially altering other tonal values or colors in the picture. It can also be used with black-and-white film, and is very useful in controlling reflections, and in photographing through glass or water.

Kodak Combination Filter Cases are available also for Series V or Series VI filters. They're handsome, two-compartment, felt-lined leather cases, priced at \$4.25 (Series V); \$4.95 (Series VI).

Kedak Pertra Lenses 1+, 2+, and 3+, let you get startling close-ups of flowers,

animals, people. They demand no change in exposure. You need only measure the lens-to-subject distance and set the camera focusing scale at the point shown in the distance table. Portra Lenses can also be used in combination for extreme close-ups. They attach easily with Kodak adapter rings.

Prices in this Kodak Bulletin are list, including Federal Tax where applicable, and are subject to change without notice.

EASTMAN KODAK COMPANY Rochester 4, N. Y.

"The support of our entrants justified the decision to try the addition of this section. The enthusiastic reception by the audiences demands continuation. This year, sequences were accepted without additional fee in order to encourage participation. Frankly, judging from the audience reaction, and from the comments of the naturalists, the successful entrant made his major contribution to the show through the series. If the fee can be considered a criterion of importance, then technically, these entrants should have been charged for their series and allowed to submit the four single entries gratis.

"We particularly wish to include in our thanks, those entrants who responded to our request for series and who did not get an acceptance. We wish they could at least have felt the appreciation of the audience which enjoyed their efforts even as they were failing to meet the more objective criteria of the jury."

Now we ask you, does the above sound as though the Kentucky show was sorry that they decided to accept sequences? I am afraid not. At this writing the Rochester Exhibition has not been judged so that we cannot report on how the acceptance of sequences in that show was received. We will, however, report in our next column.

Flowers in Winter

Imagine that you were given an assignment in midwinter to go out in the woods and photograph some tree flowers. The last flowers you saw in the fall, even after the first snow, were probably the little streamers of Witch Hazel. Then when the first really warm days of spring arrive, you expect to see the American Elms covered with their rusty brown flowers. But all winter long, if you know where to look and what to look for, you can find flowers in the woods.

Don't expect to see bright colors or smell sweet odors, for these are not that kind of flowers. They have neither petals or sepals, color or scent. They never attract insects to assist in pollination, as do the flowers that the botanists call "perfect."

All of the earliest tree flowers to appear in the spring are wind pollinated, which accounts for their highly specialized construction. The commonest form of such a flower is the catkin. It has only one sex, which is to say, it is either staminate (pollen producing) or pistillate (seed forming). Sometimes both forms of flowers are borne on the same tree, but often they are found on different trees.

Everyone is familiar with the staminate catkins that rain off the cottonwood trees right after the first warm days of spring. The pistillate catkins, pale green and inconspicuous, are borne on another tree. Later in the season they ripen, and shed the well known cotton. Another well known catkin is the "Pussy Willow," which is the staminate catkin of the Glaucous Willow before it reaches the pollinating stage. Both of these species are right now packed in their winter buds, waiting for the spring.

The mystery flowers referred to in the title are catkins, but they differ from other species in that they form on the tree in

the fall and hang there all winter in a dormant condition. If you will hunt up a White Birch tree you will find the branches loaded with little inch-long staminate catkins. The pistillate catkins of birch are borne on the same twigs, but are so little developed at this time that they will be hard to find. Before the leaves unfold enough to interfere with the dispersal of the pollen, both forms will develop, the staminate ones long and slender, drooping from the ends of the twig, and the pistillate ones erect, farther back on the twig.

Hop Hormbeam, or Ironwood, is another tree that forms its catkins in late summer or fall. These are seen in clusters of usually three, standing out stiffly like the toes of a bird's foot on the end of the twigs. As with the Birches, the pistillate catkin is slower in developing.

Alder catkins are interesting. If you will locate a speckled Alder, growing along the bank of a stream, you will probably find it covered with chocolate brown catkins. You will also find some queer little

cone-like buds on the tips of the branches. These are the pistillate flower, which finally develops into a cone-like fruit. One can often find last year's cones and this year's catkins side by side. Along the banks of the DuPage River in the Morton Arboretum is a grove of European Alders. These bear what is probably the most colorful and highly developed catkins that one can find in the winter, and are fertile subjects for color photography.

If you start a series of color shots of catkins, you will be busier than an ant at a picnic, in early spring. Just in case you don't happen to know where to look for them, just look for any of the trees in this list; Alder, Aspen, Birch, Chestnut, Cottonwood, Hazel, Hickory, Ironwood, Mulberry, Oak, Poplar, and Walnut. Catkins offer an infinite variety of form and color, but are so short lived that you will have to be on the alert to catch them in their post pictorial stage.

WILLARD H. FARR

PSA STEREO DIVISION

DON BENNETT -

28 Leonard Street, Stamford, Conn.

Business is picking up! Readership is up, too. Now seven known readers. Several of these have even paid their Division dues. That entitles you to gripe out loud. Nonmembers of the Division are allowed to mutter up their sleeves.

Know how we know we have more readers? You print something someone may not like and they howl. Works every time. Like the fellows mentioned in the letter below from our boss, Frank Rice, from out Chicago way.

But before we get to Frank's letter, there is plenty stirring stereo-wise. First of February there was a meeting to explore the possibility of setting up standards for stereo. The task committee had a successful meeting and is passing on recommendations for 5 notch 35mm stereo. It will be a year or so before the standards proposed are fully accepted by ASA, but in the interim period new manufacturers entering the field will be discouraged from starting a new size (we hope).

The proposed standard is substantially the same as now used by Stereo-Realist, Videon and a few slide makers. This allots five 35mm sprocket holes per frame. We understand there is a camera in work that would have a 5½-hole frame. Busch will remain at its current large size for obvious reasons. At least it is compatible.

A few readers misunderstood our comments on standardization. May we state them in plain language. We are opposed to any size of camera, film, tripod screw, ear-muff, auto time, steamship or airplane that is non-standard. It has been our practice for years to condemn any product, no matter how good, that is non-standard and we see no reason to change.

We do not consider the ASA label as a requirement for an item being standard. ASA usually comes along later and has been known to fail to come along where it was needed. If the new standard winds up as different from the established Stereo-Realist size, with sufficient reasons back of it, we'll go along, but since the SR has been picked because it is the oldest in the field, with accessory fitments also established, and because competitive mount firms have adopted or approximated that size, we will continue to consider the SR measurements as standard until they officially become ASA-adopted a year or so from now and then we'll start to call them ASA.

In case you didn't know it, ASA is a coordinating body. It establishes few new standards. It seeks rather to get an industry group to agree on a simplified list of measurements that will cover most of the needs, if possible reduce the stocking requirements (as in the case of wood screws or machine bolts), or establish standards of measurements as in the case of screw threads, film speed indexes, etc.

It might be an idea at this time to toss a little credit around for the participants in this stereo broth. Ansco and Eastman represented the film makers; the dealers were represented by their association, the MPD&FA; and the camera makers included Argus, Bolsey, Busch, David White, Ercona, Graflex, Sawyer's Stereocrafters and TDC. Owen Taylor and Bruno Menin represented the Stereo Society of America and the users viewpoint.

Now to get down to business. Here's Frank Rice's letter:
"Dear Don:

"You surely started something when you PSA JOURNAL, Vol. 18, April 1952

REVOLUTIONARY Diteway HOLDER ...biggest advance since sheet film!

Yes, it's the greatest news since sheet film replaced the oldfashioned plate! At last a holder that matches the accuracy of the finest camera! The Graflex Riteway is the triumphant result of four years of tests, tests, tests... and is now available for all 4x5 Graphic and press-type cameras. Compare the ruggedness...compare the ease of use...compare the features! You'll agree, there's not another film holder like the Riteway in the whole wide world!

PROVED EASIER TO USE!

Designed for speedier loading...flap folds back completely. Thinner, for faster insertion. Dual negative identification. Visual and touch signals. Anti-slip flap. Non-static dark slides.

MORE ACCURATE!

Film stays flat over entire focal plane. Rigid aluminum core and bonding film sheaths insure the perfect accuracy necessary for modern highspeed, color-sensitive film.

PROVED MORE RUGGED!

Wear-resistant, shock-resistant material plus rivetless construction, makes the Riteway three times stronger than wood, less vulnerable than metal. It cannot warp!

PROVED MORE LIGHT TIGHT!

Welded throughout ... no joints or seams to leak light. Features the spring-fingered light trap pioneered by Graflex. Solid color . . . no paint to rub off!

GRAFLEX DEALER HAS IT! a great buy at only

Grafiex I	nc.,	Dept.	32
Rocheste	8,	New	York

No mere undependable flash bulbs. No more valuable dellars thrawn away. Your initial cost is your enly cost. The CELLUX SM2 is the lightest weight portable on the quality market. Features the G.E. FT-110 tube with 75 watt seconds output. Film Guide No. 160 with Super Panchro-Press Type B film. Battery charger and handy slave unit also available. See your dealer today or write direct for complete details.

— attention — Program Chairmen!

Maurice H. Louis

APSA
of New York City
PHOTOGRAPHER OF CHILDREN

IS NOW ARRANGING A COAST-TO-COAST LECTURE TOUR, COMMENCING IN SEPTEMBER

PSA's assistant director of Portrait Portfolios and editor *Portrait Pointers* offers his interesting and educational program, "Practical Pointers on Photographing Children."

Further details on this tour will soon be mailed to clubs. If yours is interested in hearing this program write Mr. Louis at 333 West 56 St., New York 19, N. Y. Early commitment is necessary in order to arrange itinerary. said in the January PSA JOURNAL that 'clubs and wealthy addicts can afford stereo projection today, but for the other 99%, let's wait and see.' I am having letters and telephone calls from people who own projectors who say you are c-r-a-z-y! Some say you must be in league with you-know-whom, who is not yet ready to put a projector on the market. But anyway, I guess that was what you wanted to do,—start a discussion. So shall we invite the contrary-minded to give us their points of view?

"You said also in the aforesaid column that 'it is possible to mount (slides) so accurately that the adjustments need not be touched at all during a projection session.' Now that is just what we want to know—how to do it. Are you going to give us the play by play directions, or, call on some of our stereo stars to write it up? Projection is surely a headache—in more ways than one when the audience has to sit through double barreled focusing on every slide.

"You would probably like me to give you a report as to how things stand with our new Stereo Division as of now ('Now' being about seven weeks before this will appear in print).

"As a result of our President's announcement in the January JOURNAL I have had quantities of letters—so many that I have not yet answered them all. A lot of photogs are sending in their dollar and joining the Division. The first hundred which is to make up the "Founders Group" has not yet been reached. But clearly it will not be long.

"A stereo show in connection with the PSA Convention next August is assured. Norman Rothschild is in charge. Stereo will be included in the big entry form that provides for all the other exhibitions.

"The stereo slide circuits are running smoothly under the direction of L. B. Dunnigan of Royal Oak, Michigan. Always room for one more!

"After you read this, there will still be one more individual stereo competition. The deadline will be May 20. Send four slides, with sufficient postage for return to George Blaha, 4211 Harvey Avenue, Western Springs, Illinois.

"Other projects are in the making. For instance, we expect one of the stereo groups to put together the first stereo show with commentary.

"And one final word, Don. If any one has any doubt about the world going three-dimension mad, read the story in TIME, February 4 issue, about the fellow who invented a three dimension chess game. You go up and down as well as across. Good shooting to all.

Dr. Frank E. Rice, APSA"

Mind if I answer before the helpless contrary-minded can get in their licks? (All you contrary minded guys drop me a line and you'll get your lick printed if it fits. If you're still mad and I don't print it, send a copy to Fred Quellmalz and he will act as referee.)

I'll retreat to a statistical line and marshal my reserves. What is the ratio of viewers to projectors? I'll even accept a guess. I'll admit I'm sub-normal in the pocketbook and don't own a projector. (If I am in league with "you-know-whom," they had better ship me a projector on 99-year memo or I'll resign from the league.)

The defense rests.

But only after this comment . . . never, BUT NEVER, try anything photographically without first trying it! Set up a show beforehand and hold a full dress rehearsal. Don't shoot irreplaceable scenes with a new camera or strange film or a new meter. NEVER.

Henry Lubin, of Brooklyn, wrote me asking to be given a stereo job. I referred him to Norman Rothschild who will head up the stereo show at the New York Convention. Any more volunteers?

Speaking of competitions, I hear that several stereo competitions have been judged on a planar basis, with the judges seeing only half the slide! And somebody said one judge was color blind!! If this is so, competition announcements should be marked "Please indicate which frame of the stereo pair you wish judged" or "Save your money and send only black-and-white slides because the judges can't see color." Ye gods and little green apples! Do they judge color slide shows out there by projecting all entries through a C filter?

Yeah, Frank, I saw that three-dimensional chess game. It reminded me of the old-fashioned stereo where you had to be a mathematician, contortionist, and octupus to get your slides mounted. And by the third move you are going in circles headed for the fourth dimension.

End of answer.

Made a slight mistake in not giving full credit coupla months back. Stereo Society of America, Inc., was organized in 1945 or 1946 and information may be obtained from Owen Taylor, Beckman 3-2830. SSA is now affiliated with PSA, we're glad to say. The membership is largely stereo addicts and they know stereo. Attesting this is the bibliography they recently published, largely the work of Julian Warner, Bruno Menin and Owen K. Taylor. Copies may be purchased at \$1.50 through Taylor, Secretary of the SSA, 40 Monroe St., New York 2, N. Y. References are cited as far back as 1849, so you can see the boys did some work on it.

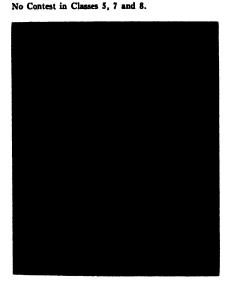

Looking back over this column, one thing strikes your conductor rather forcibly. Formerly we had little news to work on when we sat down. Now we have too much. There must be a happy blend somewheres along the road. What do you seven readers think? Shall we go back to the straight stereo column as it was last fall? Shall we tack news on the end of such a column? Shall we put news first and add some squibs about stereo? What do you fellows want? Of course, the formation of the Stereo Division was big news in itself but now the first flush is over. We can't do much about meeting notices since few clubs plan three months ahead. We'll pass on news of old meetings only when it contains an idea. We'll infringe on Jack Deschin's department occasionally when there is new product news about stereo. But aside from that, what would you readers like to have?

Questions and Answers

O. When is the closing date?
A. There is no closing date. Prints will be entered in the month during which they are received.

MASKING HANDS T. S. Hall ist Place Class I

Q. How many prints can I send each month?

A. Send as many as you like, but be reasonable, particularly in the Classes that require discussion Handling this job is hard work, and every unnecessary print adds to it, so why not just send your best print in each Class you enter? Only your top scoring print counts, anyway, so what can you lose?

scoring print in each class you enter. Only your top, scoring print counts, anyway, so what can you lose? Q. What do you mean when you say "Class 2 is for any member of PSA who makes his own prints and has not hung more than two different pictures in two international, national or state salous?"

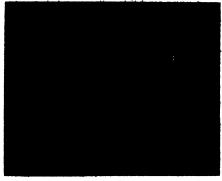

A. Gosh, folks, how can I make that any clearer? It means Class 2 is for those who make their own prints but haven't hung more than two of them in two salons. Still foggy?

Remarks

Scotch tape is wonderful stuff, it sticks and sticks and sticks, which is just the trouble. When you wrap your envelope in yards and yards, well anyway feet and feet of tape, it is like cracking a safe

CHOCTAW BOBBY-SOXERS
Hon. Men. Class 1

ON THE CATLINE H. V. Fondiller ist Place Class 2

to get at the contents, and the envelope soon looks as if a dog had chewed it. Have a heart, folks, nobody will sneak a look at your pictures, and we would like to use that envelope for the return trip. Some of you were most thoughtful, you made your envelopes easy to open and easy to return, and you rate a warm pat on the back. The very best way is to send your prints in envelopes that can be put into the standard size 9 x 12 envelopes we can easily get, and we can address these in advance and have them all ready for the return trip. When everything is assembled in your own envelope, we just alip the whole works into our stamped and addressed 9 x 12 and let'er go. You see, the different Classes of prints go to different judges in different clites, and other material is collected from

CHERUBIN E. R. DeWitt

various sources. To handle hundreds of entries and get them back to you in good condition—well, you can see what your Chairman is up against, and anything you can do to make the work easier will be appreciated.

will be appreciated.

Don't forget the return postage, first class. We do not intend to be fussy, but we would rather use our small budget for services than to make up deficient postage. We usually send back more material than we receive, which adds weight. A little extra postage for the return is usually just

Don't stick things to your prints, or paste them down to the corrugated board with tape, it leads to damage. Prize winners are mounted in books for the PSA Library and made available to other members who can't make pictures as good as

your's, and we like them to look as well as possible. That's all for this time, folks, thank you for sending prints in January and keep right on sending them. As we get more experience and better organized there will be additional features and aurprises from month to month, and you don't want to miss any of them. We are always trying to improve the service and welcome your suggestions. This is your Activity, help us run it the way you like it.

JOHN R. HOGAN, Chairman

FACTS ABOUT THE 1952 PSA INTER-NATIONAL EXHIBIT TO BE HELD IN CONJUNCTION WITH THE CONVEN-TION August 12 to 16th, New Yorker Hotel, New York

Seven divisions will be represented in the exhibit.

Deadline for all entries is July 10, 1952. Entry fee is \$2, with checks to be made payable to Frank J. Soracy, Treasurer.

All entries except those for the Technical Division exhibit are to be sent to: PSA INTERNATIONAL EXHIBIT, c/o PRE-CONVENTION HEADQUARTERS, MASTERS INSTITUTE, 310 Riverside Drive, New York 25, N. Y.

Technical Division entries must be sent to Earl R. Clark, 184 Malden St., Rochester 13, N. Y. This division will distribute its own entry forms and will assemble and judge its own exhibit. Entry forms may be obtained from Mr. Clark.

Motion Picture and Photo Journalism division exhibits will be invitational.

Entry forms for the other four divisional exhibits will be mailed to all PSA members, and others, from Philadelphia PSA headquarters. Those who do not receive entry forms may obtain them by writing to Pre-Convention Headquarters in New York or PSA Headquarters in Philadelphia.

Judging is scheduled to take place in New York, July 14 to 20, with the following juries:

PICTORIAL—Adolf Fassbender, Hon. FPSA, Hon. FRPS, Hon. M.Ph.; Helene Sanders, FRPS, FPSA; and Harvey Falk, APSA.

COLOR SLIDES—Frank E. Fenner, FPSA; Harry Haimes, APSA; and Joseph Breitenbach, ARPS.

NATURE—Samuel Dunton, Staff Photographer and Director, Bronx Zoological Gardens; Otto Litzel, President, Hypo Club; Dr. Roman Vishniac, Ph.D. Zoology, Biological Photographic Society.

STEREO—Paul J. Wolf, APSA; Bart Brooks, professional stereo photographer; and J. A. Norling, APSA, stereo engineer.

(News and Notes from page 236)

Whitesell by Paul Linwood Gittings, Lamar Hotel, Houston, Texas should contact Mr. Gittings direct. Priced at \$25 each, all of the proceeds go to Pops.

Varden to Give Brehm Lecture

Lloyd E. Varden, FPSA, will be the guest speaker at the 3rd Annual F. W. Brehm Lecture at the Dryden Theatre of the Eastman House, Rochester, N. Y., on May 13th, when he will discuss "Light Sensitive Systems in Photography."

The lecture is sponsored by the Department of Photographic Technology of the Rochester Institute of Technology, where PSAer F. W. Brehm taught for 15 years, from the founding of the Department in 1930 until his retirement in 1945.

New Zealand Convention

F. L. Bowron, who attended the PSA Baltimore Convention, writes from Christ-church, New Zealand, that they are holding a first photographic convention at Queenstown from April 24th to 30th. To quote:

"As a result of those four wonderful days in Baltimore, on my return to New Zealand I have sold the idea of a Convention to the boys of the Christchurch Photographic Society, and we have decided that the hour is ripe for New Zealand to follow suit.

"You will note on the program two PSA lectures—one by Maurice Tabard and the other by Barbara Green, also greetings messages from the PSA President and one or two other prominent PSA notables. These are going to be our star events and all the boys are looking forward to them. It is through the efforts of Ray Miess, Gene Chase, Phil Maples and others that this has become possible.

"Greetings and best wishes from all New Zealand Clubs to PSA."

Photography Year Book 1953

Top class amateur and professional photographers are again invited to submit outstanding work of the last six months for the next (1953) edition of PHOTOGRAPHY YEAR BOOK. Pictures on all

subjects agreeighle, including the following:

1. A section showing examples of the world's best pictorial photography of 1952. (This will follow an historical survey of pictorial photography written and arranged by Helmut Gernshelm).

2. Pattern. A section illustrating the use of pattern in photographic design. (This includes outstanding commercial work, scenic and purely imaginative).

International Salon, in which the pick of the entry is shown by countries.

The general conditions are:-

(a) Closing date is April 30th, with the exception of far distant countries, for which the date is extended until May 20th.

is extended until May 20th.

(b) Prints should not be smaller than 8½" x 6½", (215 x 165mm) glossy surface and unmounted preferred. Cream based prints are best avoided.

(c) Adequate packing and return postage must be included if photographs are to be returned.
(d) All entries should be addressed: PHOTOG-RAPHY YEAR BOOK, 9-10, Old Bailey, London E. C. 4. Parcels should be marked boldly PHOTOGRAPHS ONLY—NO COMMERCIAL VALUE.

B. Erle Buckley, FPSA

B. Erle Buckley, of New York, a Fellow and long-time member of PSA, died Friday, January 25, in Post-Graduate Hospital after a prolonged illness with heart trouble.

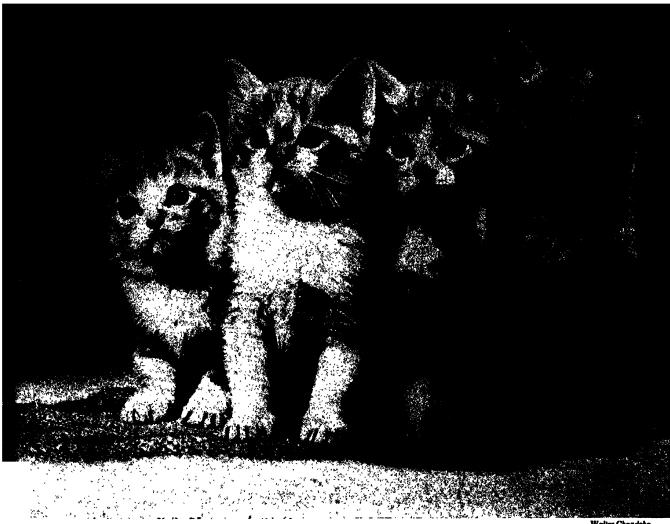

Born in New York on July 5, 1896, Buckley studied art in Europe and returned to this country to become interested in photography. For many years he conducted the Studio School of Photography, and was widely known among photographic organizations as teacher and lecturer.

He served many camera clubs throughout the East as speaker, judge, and teacher. At various times he conducted classes at eastern camera clubs, and he was directly responsible for the later salon success of hundreds of his students. He was well-known to PSA members as toastmaster at several annual meeting banquets and also as the conductor of "Buckley's Print Clinics," which established a new method of criticising photographs constructively.

An active member of the Pictorial Division, he had been also a member of the Board of Directors, chairman of the Nominating and Public Relations Committees, and was first secretary of the Star Exhibitors. He served as a commissioned officer in the U. S. Navy during World War I.

You'll make pictures true to life...with Du Pont Warmtone

warmtone gives your prints cheery brilliance and warmth that make the picture true to life. You'll be glad you "discovered" Warmtone and proud of the prints you make . . . for pictures on this fine paper are the kind you see in salon exhibits everywhere.

WARMTONE is easy to use. It is exposed and processed just like ordinary paper. And it comes in normal grade double weight in all standard sizes (25 or 100 sheets to a package)

and in these eight popular surface textures:

B White Semi-Matt
BT White Semi-Gloss

DL Velvet Grain Natural White Luster

EL Velvet Grain Buff Luster

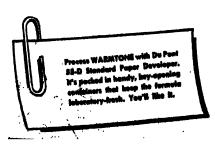

DDL Natural White Rough Luster

DS Velvet Grain Natural White High Luster

QL Cream Super Rough Luster Y Cream White Silk

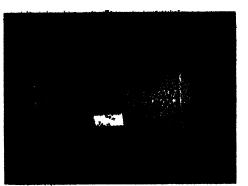

Your first package of Du Pont Warm-

tone will give you a new thrill . . . a keen satisfaction that, at last, you've found the right paper for those "best shots you've ever taken." And if you're an old hand at making salon pictures . . . you'll appreciate Warmtone even more. So try it . . . soon. Ask for Du Pont Warmtone by name. E. I. du Pont de Nemours & Co. (Inc.), Photo Products Department, Wilmington 98, Del. In Canada: Consult your photographic dealer or Canadian Industries Ltd., Montreal.

It's a thrill to show the picture just 60 seconds after you've snapped the shutter of your Polaroid Land Camera.

There's a lot more fun in cruising, camping, traveling anywhere with the camera that delivers finished prints. No waiting and wondering "how they'll come out," no disappointments, no guesswork.

Better pictures come easy with a Polaroid Camera because you see re-

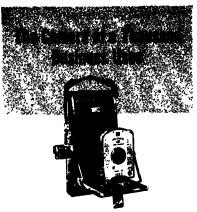

sults right away. If you're not satisfied you can change the pose, the lights, the camera angle and shoot again.

Simple to operate, too. Easy drop-in film loading. Easy to focus. Easy to set the single control for shutter speed and lens opening. Easy to remove the brilliant 3½" x 4½" finished print.

Try #1 Your dealer will gladly arrange a demonstration of the world's most exciting camera.

YOU'LL WONDER WHY YOU EVER WAITED

Every day brings reports of business jobs done faster and better with 60 second photography. Examples:

MAKES PASS PHOTOS FASTER

Polaroid Identification Camera delivers finished prints. Employees get their passes then and there! No need for temporary passes, no waiting for photos, no red tape. Anyone can operate. Folds compactly in carrying case.

SELLING IS EASIER

Real estate men use Polaroid photos for same-day posting of new listings. Sales people in many lines now produce their own photographs for illustrating proposals, specifications, new products, reports to the home office.

HOME MAINTENANCE ...

firms, landscape architects, tree surgeons, use Polaroid photos for estimating, for "beforeand-after" pictures as sales aids. Pictures in office record files also make useful reference for follow-up service and maintenance calls.

ARCHITECTS . . .

use picture-in-aminute photos to
check construction
details, record contractors' performance, and make
progress reports to
clients. Carrying a
Polaroid Camera on
job inspections saves
writing many detailed memoranda.

For complete information about the many business applications of Polareid picture-in-aminute photography, write to Polareid Corp., Dept. PS-8, Cambridge 39, Massachusetts.

You'll be proud of your "big ones" on Ansco

Cykora Paper!

When it comes to making big prints from little negatives, you'll find that Ansco Cykora is the enlarging paper that has everything in its favor.

First of all, it has plenty of printing speed for making really big enlargements with all enlargers- condenser or diffusion, incandescent or "cold" light.

Second, you'll find a contrast grade of Cykora paper that's the ideal match for your particular negative and enlarger combination. And you'll find plenty of exposure-development latitude in Cykora's rich emulsion.

Third, Ansco Cykora offers you a good choice of paper surfaces to match a wide range of sublects.

Fourth—and important to all serious workers—Ansco Cykora offers you a choice in the image color of your final print. For prints with strong, cold tones, simply develop in Ansco Vividol. For tones of pleasing warmth, use Ansco Ardol Both developers are laboratory-packaged for your convenience and protection.

For "big ones" you can be proud of, ask for Ansco Cykora paper!

THE PHOTOGRAPHIC SOCIETY OF AMERICA 2005 WALNUT STREET, PHILADELPHIA 3, PA.

HONORARY PRESIDENT

OFFICERS FOR 1951-1953

BOARD OF DIRECTORS

THE PRESIDENT REPORTS . . .

The world seems full of figures. The meeting of the Board to be held just as this issue of The JOURNAL goes to press will be the annual budget discussion, and all the committee chairmen and officers are struggling over the problem of how much can be given to each part of the Society's work. Since every one of them considers his area of activity of greatest importance—fortunately for PSA—it is not a simple matter to solve all of the dilemmas that arise. But all hands are working on it.

Some of the above is offered as an alibi for my having fallen behind in answering your letters. I hope to catch up in the coming week—but that was the hope a week ago, too. Please forgive me if yours is one of the delayed answers.

The coming Convention is building to a "bigger and better than ever" affair. According to reports from the Committee, the various Division programs are rapidly nearing completion and each of them offers most attractive features. The photographer—PSA'er or not—who does not attend will miss something of real value.

And, be sure to take your camera to the Convention. In addition to the numerous "guided tours" of New York's most photogenic areas under the leadership of the "name" photographers who know them best, "Photography Magazine" is again offering \$500 in cash prizes for the best photo-journalistic coverage of the whole Convention. The cash will go to those who tell the story best in the fewest pictures, and prints must be 8 by 10 or smaller. Open to all who attend the big week in August, the contest will make it a profitable trip for some of the gang and provide extra interest and excitement for everyone who enters it. All of us are grateful to "Photography" for its addition to our annual gathering.

Incidently, wise PSA'ers will use the registration blank elsewhere in this issue of The JOURNAL. Early registration will not only aid the Committee but will also insure your attending some of the limited doings

like the banquet on Saturday evening. "Do it now" is a good idea.

One of the interesting changes going on in PSA is the great reduction in the number of members who are not affiliated with any Division. In the past year or so the number has dropped from about 1500 to less than 500, and few of the new applications fail to indicate their field of greatest interest. The number who are registered in more than one Division has also increased considerably—a good indication of the valuable work being done by Division officers and committees.

The following is sales talk.

PSA has a great deal to offer anyone interested in photography, but you will get comparatively little from your membership unless you take an active part in it. To most members, The JOURNAL is easily worth the annual dues and we hope to make it even more valuable, but The JOURNAL is only part of PSA's value and a comparatively small part at that. The many services available through the Divisions or inter-divisional committees are far more important to the individual who uses them.

Then, as you meet PSA members, note how much more fun and interest is found by the ones who are active in the work of the various committees. As a rule, you can measure the value of the Society to the individual by what he does to increase that value to others. As in any club, the member who sits silently in the back row gets little from being there, but the workers get a lot.

There's another angle too. The working group are as fine a bunch of friends as you are likely to meet and there is no way to get to know them like working with them. That is more than a hint!

If you want to make your membership more valuable both photographically and personally, volunteer for committee work to your Division Chairman or the head of one of the committees and check up on the services which interest you most.

You can't miss.

NORRIS HARKNESS

NEW AIDS FOR BETTER PICTURE-MAKING

By JACOB DESCHIN, APSA

Things are definitely looking up production-wise in the industry to judge from the activity and general good humor at the recent St. Louis 27th annual convention and photographic trade show of the Master Photo Dealers' & Finishers' Association. Although the leading announcements were found in the movie and speedlight fields, something new and desirable was unveiled in categories across the board.

The most novel thing at the show, heralding stereophotography's entry in the movie-making field, was the Bolex stereo system, introduced by Paillard Products, Inc., 265 Madison Avenue, New York. This company showed a 400-foot amateur color movie made with its Swiss twin Kern-Paillard f/2.8 fixed focus stereo lens and projected with the Kern-Paillard Stereo f/1.6 projection lens. The film also had a magnetic sound track.

The Bolex stereo camera lens is a complete unit—not an attachment—which fits on the Bolex H-16 camera exclusively after the regular lens has been removed; the stereo projection lens, which incidentally will fit 90 percent of modern 16mm projectors, is used instead of the normal lens. Both lenses, together with a special screen, two pairs of Polaroid viewing glasses and other required accessories, will cost \$397.50.

Paillard also showed the French Berthiot f'2.8 Pan Cinor lens, the focal length of which is adjustable from 20 to 60mm in steps of 5mm. Designed for 16mm cameras, this versatile lens is coupled with a variable field finder, focuses from 5 feet to infinity and weighs two pounds with the viewfinder. The price is \$447.50. A new Bolex accessory on display was the \$126 gun stock support for the camera, which is shouldered for movie action just like a hunting rifle—almost.

No end of oh's and ah's greeted the new Revere tape recorder, trim and pretty as you please. It has several new features and costs \$225. The recorder uses a seven-inch reel for an hour's recording on each half of the tape; has a very convenient counter indexing device, piano key controls, a lever for rapidly advancing or rewinding the tape, normal and distortion recording indicators, and weighs thirty pounds. In addition, a number of accessories, including remote control cords, a \$49.50 auxiliary amplifier for large-area performance, and other items.

Keystone Camera Company, of Boston, introduced the low-priced Keystone Pathfinder K-29, a \$49.50 roll film 8mm camera equipped with Wollensak f/2.8 lens. The camera's features include 12, 16 and 48 fps speeds, continuous film run and sprocket-less loading. Another new Keystone item was the Bel Air Magazine 8, which has an adjustable viewfinder for the wide-angle, ½, 1 and 1½-inch lenses, single frame device, continuous run and four speeds, 12 to 48 fps. A third item was an editorviewer attachment that plugs into the pilot

Coorge Smallsrood, Jr., Flictographer, The Columbus Dispatch

... "Our Wollensak 15-inch telephoto is a top performer, the sharpest telephoto lens we've ever seen. To make race pictures like "Trotters," you've got to cut through track dust to get peak action. A dependable lens like the Wollensak Raptar, coupled with a Rapax shutter, gives us out-

standing photo coverage," says George Smallsreed, Jr., of the Columbus Dispatch.

You, too, can get sharp, clear salable prints. You, too, can include your ability, enhance your reputation by using the lens and shutter leading press photographers rely on . . . Raptar lens in Rapax shutter.

WOLLENSAK OPTICAL COMPANY
801 HUDSON AVE., ROCHESTER 21, N. Y.

light housing of Keystone's Belmont 16mm projector and its Regal 8mm projector. The attachment will be sold as part of the projector. The editor-viewer, which permits magnified frame by frame editing and includes a notching device to mark the film for cutting, will also be sold separately at \$12.50.

A new model of the \$1350 German-made 16mm Arriflex turret camera was exhibited by the importer, Kling Photo Supply Co., 235 Fourth Avenue, New York. In addition to many unique features and convenient handling, the camera's most ingenious device is a mirror reflex system that permits viewing and focusing through the lens while the camera is in operation. The new model, which will be available toward the end of this year, will also take Cine-Kodak lenses in special mounts. camera has an electric motor which is driven by a battery pack slung from the operator's shoulder and will run 2,000 feet of film before having to be recharged.

The new moviemaking development that permits the addition of a sound strip to single-perforated 16mm film has been incorporated in two new projectors seen at the show. One was Bell & Howell's 16mm combination optical-magnetic recording projector, the Filmosound 202; the other Ampro's. You merely project your silent film as usual and record the potential sound track, voice, music or what-have-you as you would on a tape recorder. The result is a permanent sound-on-film movie as professional as you please

A new idea from the West Coast was introduced by Windman Brothers, of Los Angeles, and was widely applauded. It is an innocent looking device that when clamped on to any model of 8mm or 16mm projector permits automatic threading of the film. You simply insert the leader and the gimmick does the rest. A slip ring that clips onto the take-up reel has small pointed projections that grip the film as the film falls into the channel of the reel. The new device, which attaches easily, was to be available in about four months and would be low-priced, the makers said.

Kodak displayed two new movie-making accessories, the Kodak Photo Light Bar for home movie-making indoors, and a transparent Kodascope reel can. The light unit, which sells for \$8.75 and takes the reflector type flood or spot lamps, has two sloping uprights which can be swiveled for superimposing the two light beams or for convenient storing. The reel can, at \$1.60 with one 400-foot reel, or separately at 90 cents, is a fully transparent plastic storage can.

Sto-A-Way, a new mat-white portable projection screen made of rubber, thus permitting closeup viewing without the annoyance caused by granular surface screens, was shown by Commercial Picture Equipment, Inc, of 1567 West Homer Street, Chicago 22. The 36x36-inch screen, which is housed in a new-type compact carrying case and is simple to set up, costs \$11 95.

"Perma-White", a new process that is guaranteed for ten years to retain the whiteness and brilliant reflective qualities of glass-beaded projection screen fabrics, is announced by Radiant Manufacturing Corp., Chicago. The material is washable, flame and mildew proof.

PSA JOURNAL, Vol. 18, May 1952

Now Make Beautiful Enlargements From Your Home Movies!

Model E 208—for 8mm film, \$37.50 Model E 216—for 16mm film, \$39.50 Each complete with Diaversal paper and everything you need for making enlargements.

Now at last, favorite movie shots can be enlarged into fine prints easily and quickly, for just a few pennies each.

Simply select the frame you wish to enlarge as it is projected bright and clear on the baseboard. Then make the picture with Gevaert patented Diaversal paper that eliminates negatives, produces deep-toned, quality prints. Any standard 8mm or 16mm lens may be used.

The Revere Enlarger-Viewer is perfect, too, for close study of your films. Used with the Revere Curvamatic Splicer, it makes an ideal editing outfit. See your Revere dealer now—he'll be glad to give you a free demonstration!

Remarkable new Diaversal Process opens new field for professionals and darkroom amateurs!

Makes superb salon-size prints from any color transparency without negatives.

Uses any standard enlarger.

Diaversal paper is now available in all sizes up to 11" x 14". This makes it possible for professionals as well as darkroom amateurs to make quality prints from any color transparency, including 35mm and 3-dimensional slides, without first making negatives. This opens tremendous opportunities for everyone in the photographic field.

Heretofore, because of the need of making a negative, a single print from a color transparency was very costly. With this sensational new process, fine quality prints may be produced directly from transparencies or slides for a few cents each. For the owner of a standard enlarger all that is necessary is a set of Diaversal chemicals, either small or large, and Diaversal paper in any standard size. Get complete information from your Revere dealer today!

REVERE CAMERA COMPANY - CHICAGO 16

The all-aluminum lightweight Germanmade Siemens Splicer and Editing Board for 16mm film has been placed on the market by Ercona Camera Corp., 527 Fifth Avenue, New York, the American distributors. When not in use, the board folds compactly. The price is \$38.75.

"Better Movies in Color", a simple guide for beginners, has just been published by Kodak at 35 cents. The 24-page miniature manual, which contains more than 60 illustrations, most of them in full color, gives practical guidance on making good movies in color, indoors and out, but does not oversimplify admittedly difficult points. The book also contains information on how to put on a show at home.

"The Handbook of Free Films", a 237page, clothbound list of almost 2,400 16mm films that may be obtained on free loan from more than 750 business concerns, organizations and governmental agencies, has just been published at \$10 by Allanan Associates, 509 Fifth Avenue, New York. The book describes each film and indicates where and how it may be obtained. More than half the available films are in color.

Sawyer's, Inc., of Portland, Oregon, makers of the popular View-Master stereo reels, showed their View-Master stereo camera for taking 37 stereo pairs on a 20-exposure roll, 69 pairs on the 36-exposure roll, for mounting in the familiar View-Master Personal Reels. The camera costs \$149 and has matched 25mm coated f/3.5 anastigmat lenses and includes several popular features. Among the accessories are an inexpensive film cutter. A flash attachment, carrying case and other items will be available later.

David White Company, of Milwaukee, makers of the Stereo Realist camera, displayed a low-priced focusing Realist Handi-Viewer, to be sold at \$9.50. The attractive new viewer has the same matched lenses, illuminating system and picture size of the original, higher priced model, which will continue to be available, but without provision for interocular adjustment. viewer lights up when the stereo slide is depressed slightly in the holder.

Speedlight and Flash

Speedlight units included the first speed flash device to utilize the new electronic circuit developed by National Carbon Company and published in the March, 1952 issue of the PSA JOURNAL. This was the Sun Lite, introduced by Hershey Manufacturing Company, of Chicago. A portable speed light source using dry batteries, the Sun Lite yields one thousand flashes per 225-volt battery, ten thousand flashes from one flashtube, recycles in five seconds, weighs 41/2 pounds and costs \$79.50, complete with battery pack, lamp unit and camera bracket. Flash guide numbers are 160 to 330 for black and white, 40 to 60 for color. The word was passed around, too, that at least four more manufacturers are preparing to use the new circuit for similar devices in the near future.

Two new Strobonar portable speed lights were introduced by Heiland, the Model III at \$189.50, the Model IV at \$369.50. The Strobonar III weighs 8½ pounds, uses a 100-watt second GE FT-110 flashtube rated at ten thousand flashes, has black and white guide numbers of 270 to 430, 45 for daylight Kodachrome, and permits time intervals of six to eight seconds between flashes. The Strobonar IV, for which guide numbers were not available at the show, is a 13-pound unit for AC or battery operation and is the first to use the new type 200-watt-second GE FT-218 flashtube. A feature of the new unit is a light control dial that permits varying the light output from 50 to 100 percent.

Powell showed an improved new model of the Powell Repeater Flash in a choice of 60 or 100-watt-second units, \$97 for the first, \$119.50 for the other. The Powell uses a portable power pack with two rechargeable batteries and comes complete with built-in charger. Weight is 5 pounds, 7 ounces. Also works on AC. The battery is charged for 250 flashes. Overnight recharging yields power for another 250. The Powell has a double plug, one for X-type shutters, another for time delay, up to 18 milliseconds.

Carl Zeiss, Inc., displayed the Ikotron speed light, a 1,200-volt unit using a dry cell battery yielding 2,000 flashes per battery. The unit costs \$265, a replacement battery \$85.

A new line of batteries for photoflash use was introduced by General Dry Batteries, Inc., of Cleveland. Makers of dry batteries for such devices as hearing aids and radios for the last 33 years, this company has used special construction features to achieve an extra long life for the new product. The company will make the D, C, penlight and 221/2-volt B-C batteries, priced at 15 cents for the D and C, two penlights for a quarter and \$1.10 for the B-C battery.

Jen Products Sales Company, 419 West Forty-second Street, New York City, had \$14.95 Jen B-C flashguns for the Argus and the Speed Graphic, with shoe clips to fit both cameras, and a group of flash accessories. Two were vertical brackets for the Rolleiflex and the Stereo-Realist, each \$1.95, a third was a universal accessory shoe clip at \$2.50.

The concentrated-arc source zirconium. the pin-point light source revealed by the Western Union Telegraph Company soon after the war, came into the news again in Sylvania's booth. This manufacturer of flash and flood lamps, who now has control of the arc source, demonstrated the possibilities of the lamp in projecting images directly without a lens. The lamp is available in wattages ranging from 2 to 300, open arc to 1,000.

Accessories, Etc.

A photoelectric type exposure meter designed for use with the Minox camera was one of the show's accessory attractions. This is a metal device measuring about 1x11/2 inches and about a half-inch thick, and costs \$24.95 with leather case. This German-made meter may be adjusted for ASA speeds of 10, 20, 40 and 80. The meter is first set for a lens opening of f/2, 2.8, 3.5, 5.6 or 8, then read directly in terms of shutter speeds.

PSA JOURNAL, Vol. 18, May 1952

My Photo Dealer is.

Now you can make <u>low-cost</u> sound movies

Now Bell & Howell brings the making of sound movies within your reach. Here is the new 16mm Filmosound 202—not just a sound movie projector—not just a magnetic sound recorder—but a combination of both for making and showing sound movies. You need no expert knowledge, no costly professional equipment.

With the Filmosound 202, narration and sound effects to accompany the film can be recorded just the way you

want them . . . while all details are fresh in your mind. Changes in the sound can be made when and as often as you want them. Only with magnetic sound movies is this possible at but the cost of the film and SOUNDSTRIPE.

Now you can add sound to old silent films...new sound to a film with an obsolete sound track. Use coupon for full details on magnetic sound movies and the new Filmosound 202. Or see your Bell & Howell dealer today!

Record voice and sound effects, and mix voice with musical background, as picture is projected. All recording errors can be easily and quickly corrected. Magnetic recording will last for life of the film, yet can be changed instantly.

You're ready to project movies with sound immediately after you record. Later, to change the sound, erase and record again in one simple step. Remember, your Filmosound 202 will project any 16mm film, silent or sound.

You buy for life when you buy Bell & Howell

the sensational, new 16mm

Filmosound "202" RECORDING PROJECTOR

Guaranteed for life: During the life of the product, any defect in material or workmanship will be remedied free (except transportation).

Burleigh Brooks Co., 10 West Forty-sixth Street, New York, displayed the new \$95.66 Schneider 35mm Kenogon f/2.8 wide angle lens coupled to the rangefinder of the Leica, and the Excelsior tilt top head at \$6.75. Accessories for the Rolleiflex included a new \$3.75 focusing extension hood made of fine bellows leather and incorporating a nose guard; and a graduated filter that fits snugly over the Rolleiflex lens shade. This filter, which costs \$10.20 with leather case, has been returned to the market after a lapse of ten years.

Saul Bower, Inc., 114 Liberty Street, New York, showed the Bower Photo Flash Unit, a handsome, well designed but low priced—\$6 for reflector, battery case, cord and bracket—highly polished aluminum gun for most cameras with built-in flash synchronization. The company also had a series of steel cable releases of the locking type, with wing handle. A 20 and 40-inch release for the Compur shutter is \$2 and \$2.50, for the Leica, \$3 and \$3.50.

A series of Gadg-It Bags in a new tropical tan shade was on view in the Diamond Case Division of Louis Lefkowitz & Brother, Inc., New Brunswick, N. J. Made of Swedish leather, full grained and without dye, the cases are \$10.50 to \$49.75 depending on the size, which ranges from that for the miniature camera to a case for 4x5 press cameras.

A good looking, roomy case with large outside pocket and made of top grain cowhide leather was offered by the All-American Goods Company of Chicago. Other features of this \$39.95 case, which will accommodate cameras up to 4x5 and accessories, include a sturdy stainless steel frame, a sponge rubber bumper on the back of the case, a large bellows pocket inside the lid, adjustable partitions and an adjustable double leather carrying strap with sponge rubber, leather covered shoulder pad.

A new Rapax No. 4 shutter with full synchronization and press focus lever was shown by Wollensak Optical Company. Speeds of this \$75 shutter are ½ second to 1/200th. It will take 7½, 8¼, 9½ and 15-inch Series 2 lenses.

Alfa Photo Corp., 303 West Forty-second Street, New York, displayed the Teweflex, a reflex viewer for the Leica or Contax type camera. The device incorporates a new type mirror design, a five-power magnifying viewer and a 25-power critical focusing feature.

The Deluxe Cordomatic spring-back reel, holding 18 feet of heavy duty rubber covered cord (two wires plus ground), is announced by the Air Photo Supply Corp., 555 East Tremont Avenue, New York. The \$5.95 device is equipped with a mol, and has a tension lock to stop the cord, an automatic rewind and a bracket for attaching to wall or equipment.

The Alpa-Kenon 50mm f/1.9 lens for the Swiss 35mm Alpa Reflex and Prisma Reflex 55mm cameras is announced by Heitz and Lightburn, 150 West 54th Street, New York, the importer. Of the Gauss type with six elements, the lens is coated on all free surfaces. It is supplied with a special red focusing mark for taking infrared photographs with dark red filters. Equipped

with the new lens, the Reflex is \$357, the Prisma Reflex, \$427.

Stereo Slide Service, Old Greenwich, Conn., official Eastern mounting service for the David White Company of Milwaukee, offers 48-hour service. Same-day service also available for small additional charge. The company has economy coupon books for processing ten rolls at intervals.

A revised edition of "Kodak Wratten Filters for Scientific and Technical Use" has been published by Kodak at 75 cents. The list covered includes more than 100 filters for black-and-white and color photography and scientific uses.

Graflex, Inc., is now equipping all Graflite flash units with the new Graflex Testlite in place of batteries. The Testlite has a small socket holding a conventional flashlight bulb and is used to check that all battery case connections are in order for flash use. The Testlite may be purchased separately for sixty cents.

Five new brushes for spotting and color prints, one of which, designed for amateur use, is the Kodak Spotting Brush No. 2, a general purpose brush costing 45 cents. The other four are Kodak Deluxe Spotting and Coloring Brushes in sizes 0, 2, 6 and 8, made of high quality camel's hair and costing from 60 cents up.

Kodak Ektachrome roll film is now available in Type B for use in artificial light, including flash, as well as in the daylight type. The new lamp is balanced for use with the clear 3200° Kelvin flood lamps. When using clear flash lamps, a Wratten 81-EF filter is required. The film rating is ASA 6, the price \$1.79, the size 120 and 620. Data sheets containing specific filter information on the emulsion used in manufacturing each roll are packed with the film.

Cameras, Projectors

DeJur-Amsco, of Long Island City, N. Y., showed models of their long-rumored twin-lens DeJur Reflex twin-lens camera, this company's first camera in the still field. When available for the market in the near future, the camera will sell for under \$100. It uses 120 film, has a Wollensak f/3.5 lens, Alphax synchronized shutter with speeds to 1/200, a focusing hood that opens at the flip of a lever and simplified film loading with protected film window.

A new 35mm Japanese camera, the Konica, with a 50mm Hexanon coated f/2.8 five-element lens that is said to have unusual covering power, was seen at the show. The camera was introduced by its importer, Rayelle Foreign Trade Service, of 76 West Chelten Avenue, Philadelphia 44. Rather impressive at the price of \$135, the camera is well made, has a collapsible lens mount, Compur Rapid type synchronized shutter, an ingenious combination rangefinder and viewfinder and other popular miniature camera features.

Burleigh Brooks Company displayed three models of the new German-made Regula 35mm camera, all with synchronized shutters. With 50mm Steinheil Cassar f/2.8 coated lens in Compur Rapid M-X flash shutter, the camera is \$65.50; with the same lens, but in Prontor S shutter with M-X synchronization, \$55.85; with 50mm Stein-

heil Cassar f/3.5 coated lens in Prontor S shutter, \$48.50.

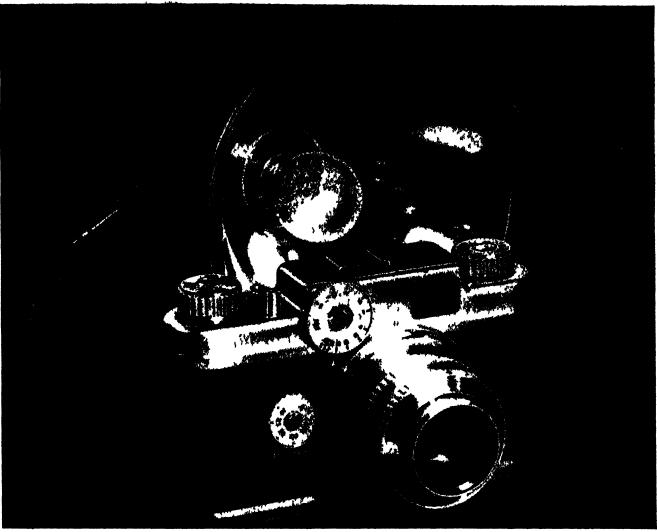

Carl Zeiss's new camera was the medium priced 35mm Contina, equipped with Zeiss Tessar coated 1/2.8 lens, M.-X sychronized Compur Rapid shutter, built-in rangefinder and film reminder. The same camera is also available with the Novar 1/3.5 lens in synchronized Prontor SV shutter with speeds to 1/300.

The \$18.95 Isofiex I box-type camera was a feature in the booth of Benard Sales Company, 150 Nassau Street, New York. The camera has a coated lens with 1/7.7, 11 and 16 openings; a focusing mount, built-in synchronization, large size brilliant type viewfinder, double exposure prevention and takes 12 pictures 2½x2½ inches on 120 roll. The company also displayed a series of cable releases ranging from 6 inches to 10 feet and costing 75 cents to \$8.

The first postwar version of the 35mm Dollina, the Super Dollina II, and a new 35mm Edinex Midget Marvel, have been imported from Germany by Camera Specialty Company, 50 West 29th Street, New York, the American distributors. Dollina is a bellows type miniature that swings out for action at the release of a simple spring catch. It has a Zeiss Tessar f/3.5 coated lens in a flash-synchronized Compur Rapid shutter with speeds to 1/500th; split-image rangefinder camcoupled to the lens board and double exposure prevention. It costs \$129.50, The Edinex Midget Marvel is a \$29.95 miniature with an f/4.5 coated lens in a Prontor S flash-synchronized shutter with speeds to 1/300th. Other features include a built-in self-timer, an optical viewfinder and a depth-of-field scale engraved on the lens mount.

Three types of projectors were introduced. The Three Dimension Company's (4555 W. Addison Street, Chicago 41) TDC Streamliner 500 Duo for projecting both 2x2 and 21/4-inch-square slides, has a 500watt lamp, AC blower cooling and a 6-inch f/3.5 lens and includes changes for both slide sizes. A 300-watt \$69.50 model of the Duo is also available. American Optical Company, of Boston, has a Delineascope Model GK bellows type projector designed for 31/4x4-inch slides, but also taking, with accessory slide holders, the 2x2 and 21/4x21/4 slides. This blower cooled projector permits focusing the 750-watt lamp for the different double condenser units required when handling the various slide sizes. Available lenses vary from 61/2 to 24 inches and the projector price, depending on the lens selected, ranges from \$220 to \$327.50. The third type projector was the midget, low-priced 5x5-inch model of the Visual Cast, a device for front-ofthe-room projection of photographic or other transparencies by laying the material on an illuminated table and projecting the image by means of an overhead wide angle lens and a mirror placed at a 45-degree angle to the projection screen. Folded, it forms its own carrying case. It weighs 10 pounds and costs \$75. The maker is Victorlite Industries, Inc., 5350 Second Avenue, Los Angeles 43.

Another projector, one of the smallest ever made, was one designed for the Minox camera. It is called the Hollyside, uses an

argus

-world's largest manufacturer of 35mm cameras

f/4.5, 2-inch lens in focusing mount, is convection cooled, uses a 75-watt lamp, and costs \$30.95.

Darkroom

A new 8x10 Time-O-Lite contact printer employing as light source the Aristo variable-color light unit for printing Varigam variable-contrast paper, was seen at the show in DuPont's booth. By operating a switch the light changes from green to a mixture of blue and green, and finally blue. With Varigam this results in contrast changes, with other papers the change is in the printing speed, the fastest exposure at the blue end, the longest at the green, with variations in speed between the two. The Aristo contact-print source will also be available in sealed units to fit all standard contact printers from 5x7 and up.

Kodak introduced a new Kodacraft miniature roll film tank for developing two rolls of 35mm or 828 film at the same time. The new tank is the daylight loading type, employs 35mm width aprons and costs \$2.53. The aprons are also sold separately at 55 cents each.

The demonstration of Photo Sweep antistatic spray, the new static eliminator for negatives, drew attention to the booth of the Electro Chemical Products Corp., East Orange, N. J. Negatives treated with Photo Sweep, then wiped lightly with a soft cotton cloth, remain free of dust for a considerable period. The company also has a negative strip applicator with an overhead cup for supplying anti-static fluid to moisten two pads between which the film is drawn for cleaning and wiping in the same operation.

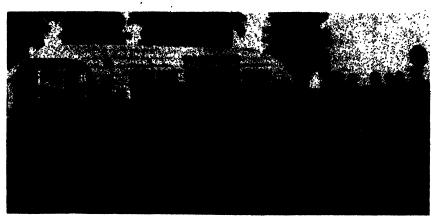

Franklin M. Morgan, 303 West Fortysecond Street, New York, introduced the Lawler LTC Temperatur Control unit with internal moving parts of stainless steel. Fully automatic, this thermostatic unit costs \$110, the assembly including a tail pipe for delivery of tempered water to water jacket or sink. The unit is made of chromium-plated brass.

Cykora, Ansco's medium high-speed, warm tone chlorobromide enlarging paper, is now available in a glossy surface, double-weight paper, in contrasts 1, 2 and 3.

Federal Manufacturing & Engineering Corp., of Brooklyn, N. Y., has published a new booklet, "Enlarging for Beginners", which is just that, and costs only a dime—at your dealer's.

Speaking of enlarging, a very helpful little booklet on how to improve the quality of your prints may be obtained free of charge from Simmon Brothers, Inc., 30-28 Starr Avenue, Long Island City 1, N. Y. The booklet is "The 3 Basic Points of Print Quality" and the author is Rudolph Simmon, the idea man of his famous company and an enthusiastic amateur photographer.

Although not a new product, but still as popular as ever, are the hand-painted ties of rayon or nylon in maroon, bright red, navy, medium blue, dark green, brown and gray, available at \$5.00 each, postpaid, from PSA Headquarters, 2005 Walnut Street, Philadelphia 3, Penna.

The registration trailer at Santa Barbara PSA Town Meeting last March. Photo by Holloway.

PSA Town Meeting Great Success

(EDITOR'S NOTE—the following report of the PSA Town Meeting of Photography in Santa Barbara, California, on Saturday, March 1, is printed in full as received from Boris Dobro, the Chairman of the event-because of its great interest to PSA members in general and also because it may provide other individuals and groups with a wonderful idea for an interesting and educational day in their own communities. If further details are desired, please ask Headquarters for the information.)

A trailer was provided by a local dealer for registration purposes. It was located on Cabrillo Boulevard at State Street. The registration started on schedule at 8 A.M. Mrs. Elizabeth Stewart gave out badges and ribbons to the "Officials" (members of local camera clubs and Honor guests). Everyone else received a sticker for his car and a city map. In spite of the prediction of rain, more than sixty people arrived and registered before 9 A.M. Representatives and guests from Paso Robles, Arroyo Grande, Atascadero, San Luis Obispo, Santa Maria, Lompoc, Ventura, Oxnard, Santa Monica, Hollywood, El Monte, Alhambra, Redondo Beach, Long Beach, Los Angeles, Pasadena, and as far away as Fresno (250 miles) and San Diego (225 miles) attended.

At 8:20, the first caravan of seven cars guided by two local photographers, started out for shooting around the beautiful grounds of the Court House. A large sign reading: "PSA Town Meeting of Photography", was so conspicuous it completely dominated the courtesy sign of the dealer on the trailer, which made it easy to find.

As new groups arrived they were immediately directed to the location of their choice for shooting under the guidance of the local camera club members. The Chairman drove around from one location to another and supervised the shooting.

At 12 noon, a crowd of more than 200 interested people assembled at the BROOKS INSTITUTE OF PHOTOGRAPHY where six beautiful models and a "bride and groom" couple were available for photographing. Mrs. Elizabeth McMenemy,

PSA, took care of the registrations here. In the large studio, with proper background and lighting, the "bride and groom", set up by Herbert Boggic, were photographed by the eager amateurs, while out on the patio and the spacious grounds at BROOKS, models, dressed in Spanish costumes and formal gowns, were posed by Richard Boyce, PSA, for outdoor shooting. One of the most interesting attractions was a model with an off-the-shoulder costume (very voluptuous effect), who proved very popular with the most ambitious photographers.

Fred Archer, assisted by Russell Illig, PSA, demonstrated "Portrait Lighting", while in the "Color Lab", dye transfers were made by students supervised by Charles Perry, PSA, under the observation of an interested and appreciative crowd. The shooting session was the most successful part of the day, and it was with reluctance that the huge crowd left the grounds to continue with the next features of the program.

At 4 P.M., some fifty color enthusiasts assembled in the High School projection room. Merle Ewell, assisted by Al Stewart, Henry Greenhood, Floyd Norgaard and Vella Finne, conducted a Color Slide Clinic, in which only slides provided by the public were shown and discussed.

At the same time, a Print Clinic was in progress at the Recreation Center, conducted by Harvey Brown, Fred Archer, Floyd Evans, Ernest Brooks, Mel Phegley and Boris Dobro, with the audience participating. Approximately seventy-five "shutter bugs" were present. It was regrettable that the amateurs did not supply sufficient prints for discussion, so that stock prints had to be used. They were also negligent in bringing in prints to the tables for personal advice on their work; however, the crowd responded with lively enjoyment to the questions and answers period. Both meetings adjourned at 6 P.M.

At 7:30 r.m., 151 people gathered in the auditorium at the Recreation Center for the closing event of the day. Mr. Boris Dobro gave a lecture on "How to Improve Your Snapshots", and stressed the im-

PSA JOURNAL, Vol. 18, May 1952

portance of composition. Mr. Rex Fleming, PSA, was very helpful with props and lights, and Hal Beckwith, PSA, was responsible for the stage direction.

The PSA Service Medal was presented to Ernest H. Brooks by Harvey Brown, and Fred Archer read a message from Shirley Hall, who was unable to attend, which explained the plan and program of PSA. Al Stewart gave a lecture, "How To Improve Your Color Slides", and Harvey Brown presented a collection of world famous prints by Max Thorek, Fraprie, and others. The meeting adjourned according to schedule.

The photographers who attended left with the mutual feeling that it was a day well spent, and a fine day for the PSA.

Many asked: When do we meet again? Boris Dobro, APSA, Chairman

Here's News

These notes are printed in the order received from around the country.

Howard E. Foote, APSA, New York City, has added an ARPS to his name . . . Merle S. Ewell, Los Angeles, and Eric Ergenbright have organized "Through the Lens Vacation Tours" and the plans sound good . . . Henry W. Greenhood, Hollywood, was seen recently taking a picture of a "character" at Beatty, Nevada, and telling his subject to "wait a minute 'til I take one on the other side of ,the film" . . . His generosity is going to leave his grapefruit trees bare un-Les Mahoney takes care out there in Phoenix, Arizona . . . Geraldine Fields, Phoenix, has announced her engagement to Dudley Peebles. . .

It was almost a hundred per cent PSA cast when judges for the Rochester International Salon got together last month in Rochester, N. Y.; they were Gottlieb A. Hampfler, Kennett Square, Pa.; O. E. Romig, Pittsburgh; Helen C. Manzer, Jacob Deschin and Thomas J. Maloney, all of New York City; Dr. Gordon B. White, Ontario, Canada; Arthur M. Underwood, J. Lawrence Hill, Jr., and Fritz Trautman, all of Rochester, N. Y. . . The Arthur S. Mawhinney's, New Rochelle, are no longer raising dogs; it's now African violets. . . John Howard and Tom Miller, both Rochester, are in show biz; they arrange instructional meetings for Kodak personnel and "pack 'em in". . . Eva Briggs, Detroit, is just sending out her New Year's greetings with a Briggs choir-boy photograph on the cover, the lady herself photographing actor Leo Carrillo on the back page, and a vibrant message between. . . And speaking of that Briggs gal, she staged a Gallery showing on March 8 of "Detroit's Women of Achievement," using Briggs photos, of course.

Irma Louise Carter, Manhattan Beach, Calif., is flying around the world, talking to PSA clubs on the way . . . Long time editor of PSA Journal, Fred Quellmals, Jr., Hon. PSA, has been elected a director of Kutztown ROTARY Club.

And what's new with the rest of you? Put it on paper and mail it now while it's still new.

BOOK REVIEWS

THE FACE OF WAR, by Charles and Eugene Jones, Prentice-Hall, Inc., 70 Fifth Ave., New York 11, 166 pages, 73/4 x 103/4, illustrated, cloth, \$5.00, 1951.

Two news photographers, 26, twin brothers, who had flunked the Marine Corps photo school, went to Korea as TV cameramen for NBC. In the course of riding into Pyongyang with the tanks, 'chuting into Sukchon with the paratroopers, hiking into Seoul with the infantry, and boarding Marine Corps assault boats to Inchon's "Blue Beach One," they exposed 26,000 feet of 16mm film in their Filmo movie cameras.

From these reels, shots which reflect the war in the faces of those who live and die on the field of battle have been enlarged, some to full-page. Since 16mm movie film is nonchalant about grain and scratches, print quality causes no concern here. There is none. So this book serves the good purpose of proving to fussy photographers that print quality is merely one attribute of a picture, and that movies converted to stills still can be moving.

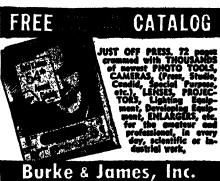

The Jones brothers knew what they wanted, and proceeded to get it, sustaining wounds in the process. They have produced a virile book illustrated with living photographs and written in—terse. dirty, fatalistic GI verbiage. A book which reflects modern warfare in the tense, soiled, frightened faces of men, women, and children. A book which makes the photographer glad he is part of a photography which can produce such results; and not too happy that he is one of the human beings who permit such things to happen.

No amateur will learn much about the technique of photography by reading this book, but of the possibilities of photography he will see and learn greatly. Photographs which, bereft of darkroom abacadabra, are stark, moving drama; pictures which really speak. Embellished by text which takes the reader as close to war as likely he'll wish to get.

PRINT QUALITY, by Alec Pearlman, The Fountain Press, London, England, 116 pages, 5 x 7¹/₄, illustrated, cloth, \$3.25, 1951. Available from Rayelle Publications, 5700 Oxford St., Philadelphia 31, Penna.

Print quality is defined by this author as a certain elusive attribute which customarily is found in the work of other photographers, but which so often escapes the common, or garden variety, amateur. In this informative volume he tells how print quality may be captured, although, in the process, he presents what amounts to an advanced course in photography.

For so small a book, this little volume packs a mighty lot of photography. The numerous steps to print quality are explained in detail. And so is "balanced lighting," a photographic method which will help every photographer to improve his pictures and automatically to incor-

porate many, if not all, of the elements which combine to make print quality.

The book starts with the beginning of print quality—the negative—and goes on to show how to make and to tone prints for top-quality effects. Additionally, there is a valuable chapter on the photography of snow and water.

There are numerous examples of print quality in excellent reproductions of photographs made by the author, plus his own enlightening explanations of how he made the pictures. In effect, this is a text book, but it is one of those fascinating texts which the amateur won't want to close.

PSA TRADING POST

Open to individual members, free of charge. Limit 25 words each. Copy closes the tenth of the second preceding month before publication.

For Sale—105mm f/6.8 Leitmeyr Weitwinkel lens, coated in Prontor II (2) flash shutter 1 sec. to 1/200 T.B. will cover 4x5. New \$25. Justin Hartley, Colchester, Conn.

Wanted—Direct focusing magnifier attachment for Zeiss Ikon "Movikon" 16mm movie camera, supplementary lens for 2.5cm lens and Movikon 16mm, 50 ft. cassettes. George E. Marak, 1104 S. 25th St., Colorado Springs, Colo.

For Sale—Speed Graphic 21/4 x 31/4, like new, Optar f/4.5, film holders, f.p. adapter, range finder, filters. Levin G. Hayman, Box 45, Salisbury, Md.

Wanted--11 in. lens for Kodak Master Slide Projector. N. Merrifield, 260 N. Algoma, Port Arthur, Ont., Canada.

For Sale—DeJur Versatile II less lens, like new. 35mm to 3¼ x 3¼ negative holders. James E. Barta, 130 Market St., Passaic, N. J.

To Swap—Retina 35mm slide & strip film projector, case, etc. 2½ x 2½ projector desired. H. O. Ranger, 1 Gaylord St., So. Hadley Falls, Mass.

For Sale—One copy of Wall's "The History of Three-Color Photography." Rare, out-of-print book in excellent condition. \$50.00. George W. Sawdey, Research Laboratory, Kodak Park, Rochester 4, N. Y.

OCEAN THRILLS AWAIT PSA VACATION-TIME CONVENTION VISITORS

FIELD TRIP STEAMER TO CRUISE NEW YORK HARBOR AND MAJESTIC HUDSON

By Jack A. Goldsack

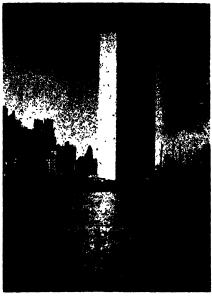

Americans returning from abroad and others who reach these shores for the first time unanimously agree that the most inspiring picture in the world is the first thrilling sight of New York harbor as they sail up the Narrows.

One cannot help but be overwhelmed by the spectacle. Dominating the scene is The Statue of Liberty and the downtown towers of Manhattan, the heart of this perpendicular city. To the right Long Island stretches from the Brooklyn docks for a hundred miles eastward. Staten Island, famed for its Revolutionary history is to the left.

The ship glides smoothly past Governor's Island, a major military establishment. In a matter of moments you reach the inner harbor where you can focus your lens on a variety of breath-taking views. You can almost reach out and touch the famed Statue. The magic skyline, the huge suspension bridges, monster ocean liners flying the flags of many nations and busy fast moving tugs all vie for your attention and invite you to unlimber your shutter finger.

Your ship veers to starboard and you are now in the majestic Hudson which combines beauty with the bustle of commerce. It has often been said this river is far more beautiful than the Rhine. Certainly it has more to command your interest and attention.

If it has never been your good fortune to have made this trip, and even if you have, so long as you are interested in pictures, here is good news. You have a thrilling experience ahead. For this is only one of the major field trips awaiting you at the New York Vacation-Time Convention of PSA. And, says Ed Wilson who has planned this unusual event, "It will be a humdinger!"

A new addition to the New York skyline is the striking United Nations Building. Photo in 1951 by Floyd A. Lewis.

You will board a streamlined steamer, the State of Pennsylvania, with ample accommodations for 3,400 passengers comfortably. This veritable ocean liner has been chartered for the entire afternoon of Thursday, August 14th. This is no mere boat ride. The entire purpose of the four hour cruise will be photography and fun. You will see and shoot the New York skyline and other points of interest from positions and angles you could not possibly approach unless you chartered your own ship. The skipper and crew promise to

bring the ship in close wherever possible to give you ample time to shoot.

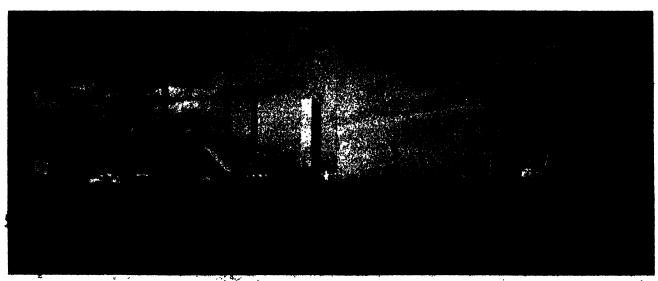

Arrangements call for the Captain to proceed around the harbor, up the majestic Hudson to take in important landmarks like the huge George Washington Bridge, Riverside Church, the Cloisters and then up past the famous Palisades. You will see these grand sights from another viewpoint as the ship plows its way back down the Hudson and into the busy East River. Here you will sail past the new city of the United Nations with excellent opportunities to see New York's famous skyline from both shores of Manhattan Island. These views will include the enormous Empire State Building, tallest in the world. There will be many other opportunities for sweeping views and close-ups of the Long Island and New Jersey shores as well.

Experts will be aboard to point out the most interesting and photogenic spots and suggest angles and exposures. A bevy of Conover models is being retained to furnish foreground interest at the discretion of picture makers. So, if you want "cheeseake" that will outdo the work of press photographers who meet all incoming vessels, here's your opportunity.

The price for all of this, believe it or not, is only \$2.50. For this small sum you can join almost the entire PSA Convention attendance for a four-hour cruise that will be unique in the annals of amateur photography.

For detailed suggestions on what to photograph, your attention is called to the article by Floyd A. Lewis, which appears on page 311 of this issue.

And don't forget to immediately mail in your Convention Registration form, which appears opposite. It is important that this form be received without delay.

The Round Manhattan Boat Trip will give emple exportunity for views such as these by Edward C. Wilson, APSA, Lett: Midtown

310

skyline with Chrysler Building on the left. Right: Liner passing Statue of Liberty.

Take Your Camera on a 'Round-Manhattan Boat

FLOYD A. LEWIS

For some superb photos of New York that you can't get any other way, take a boat trip around Manhattan Island. For best results, go on a day when the sky is clear and sunny. White fluffy clouds will give your shots dramatic quality if you use a filter (use a haze or "skylight" filter with color film).

If for any reason you can't take the PSA Convention boat trip, or if you want additional pictures during your visit to New York City, boats leave daily from the foot of West 42d Street at 10:30 AM and 2:30 PM, April to October, inclusive. During the summer there are additional sailings at 11:00 AM, 2:00 PM, 3:00 PM, and an evening sail at 6:00 PM. The trip takes three hours and covers about 35 miles.

If you want to be sure of a choice seat, get on board at least a half hour before starting time. There are a number of good vantage points from which you can get good shots; but as the boats sail south from 42d Street and go counterclockwise around the Island, it is best to take a seat on the left side which will be toward Manhattan. Go to the upper deck where you will find seats along the sides with unobstructed views. Other good vantage points are the open areas at the front and rear of the main*deck; these locations are especially good for shooting bridges.

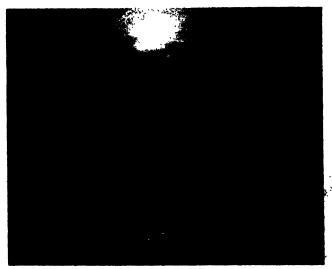

You must be alert at all times when approaching "targets" lest some of the best shots be lost, for there is no possibility for shifting back to an especially good point of view once you have passed that point.

Use a shutter speed of at least 1/100 second if possible to prevent blurring on account of the motion of the boat. If your camera doesn't have this high a speed, however, you can still get good shots if you aim at an angle either forward or backward from the boat. In fact, it is good insurance to shoot that way, rather than straight out from the side of the boat, even when shooting at 1/100 second or faster.

As the boat pulls out into the Hudson, you will probably be amazed at the amount of river traffic. If you like pictures of boats, and almost everyone does, you will find a wide variety from which to choose—ferries, tugboats, freighters, barges, and a myriad of smaller craft. You will see at least one large liner at the dock, and you might even see one either arriving or departing. If you are lucky, you might see one of New York City's several fireboats in action. The huge sprays these boats are capable of pumping, make a very dramatic shot.

All of the 'round-Manhattan boats carry guides who call attention to important buildings and other points of interest over a loud-speaker system. Most of these stand out clearly enough from their surroundings so they can easily be photographed. Among those you may shoot on this first leg of the trip are the huge Starret-Lehigh

Building which has an elevator large enough to handle fully loaded freight cars; the Port Authority Building which is an inland freight station handling less-than-carload shipments and also the headquarters of the New York Port Authority, operator of more than \$300,000,000 worth of tunnels and bridges around New York, a grain terminal, and a pier in Brooklyn; and the Bell Telephone Laboratories, that great research center devoted to the development of better telephones and other communication equipment. You can also shoot the ventilating buildings of the Lincoln and Holland vehicular tunnels standing at the water's edge on both the New York and New Jersey sides.

NEW YORK'S BRIDGES

E. C. Wilson, APSA

As you proceed down toward the southern end of Manhattan, you approach one of the most spectacular sights of the whole tour—the skyscrapers of New York's financial district that have become so famous in skyline views of the City. There is an almost endless number of picture possibilities here. You will have two chances to get these shots—as the boat emerges from the Hudson, and after it has turned to begin the second leg of the tour up the East River.

But we're getting ahead of the story. Before turning into the East River, you will sail near the most famous sight of the entire trip—the Statue of Liberty. Situated on Bedloe's Island at the entrance to Upper New York Bay, this noted landmark, which has greeted bundreds of thousands of emigrants and visitors to our shores, stands as a symbol of friendship between the French and American people. You will have chances to shoot the Statue from two good angles, as the boat approaches and after it has turned.

Before reaching the Statue of Liberty, you will pass Ellis Island, the port of entry through which all emigrants entering the United States via New York must pass. After leaving the Statue, you will sail past Governor's Island (on right side) where Fort Jay and the First Army headquarters are situated.

Get set now for the busiest picture-taking part of the whole trip. As you start up the East River you will get some of the best views of the New York downtown skyline. Then come two of the City's most famous bridges—the Brooklyn Bridge, granddaddy of all big suspension bridges; and the Manhattan Bridge, a more modern structure. Both bridges offer good photo possibilities themselves and good skyscraper-under-bridge shots as well.

Soon you will pass the famous Brooklyn Navy Yard where many U. S. Naval vessels are built; this will appear on the right side of the boat. There are always a number of big ships in the Yard and usually a submarine or two as well as smaller craft.

NEW YORK HOSPITAL

Floyd A. Lewis

Just before reaching the Navy Yard you will pass one of the biggest electric power plants in the world, the Hudson Avenue Station of the Consolidated Edison Company. As this is in Brooklyn, it likewise will appear on the right side of the boat. This is only one of several power plants that the guide will point out, and if you like to shoot such things there are several good possibilities along the Manhattan shore (left side).

Next is seen the Williamsburg Bridge, third and newest of the three large suspension spans connecting Manhattan and Brooklyn. Along this part of the trip too are some of the new large apartment developments of New York's lower East Side. Some of these are slum-clearance projects for people of low income; others are regular commercial apartment developments.

Get set now for midtown skyline shots including the famed Empire State Building, tallest building in the world, and the big buildings centering around 42d Street. Some of these are taller than the downtown buildings, but they are farther from shore and therefore don't look so spectacular from the boat. Nevertheless, there are a number of excellent skyline possibilities here that you undoubtedly will want to get.

Near the shore just north of 42d Street is a new addition

...

to the City's midtown skyline—a strikingly dramatic addition that is earmarked to become one of the most prominent spots in the entire city. This is the head-quarters buildings of the United Nations. Already completed is the 39-story Secretariat Building with its two major walls in effect two huge aluminum-frame windows. Other buildings are under construction. There is no better point of view for shooting the U. N. Building than the 'round-Manhattan boat.

The Queensboro Bridge connecting Manhattan with the Borough of Queens is now in full view. The structure of this bridge, which engineers call cantilever, differs from that of the other large New York bridges. Its center support rests on Welfare Island which is the site of a number of City institutions. The sightseeing boat goes up the channel between Welfare Island and Manhattan.

A short distance north of this bridge is an institution whose charter was issued by King George III in 1771 when New York was still an English Colony. This is the New York Hospital which together with the Cornell University Medical Center now occupies the huge cathedral-like structures along the shore between 68th and 72d Streets.

From here on you can relax more, as the good photographic possibilities are fewer and farther apart. You will be amazed to find how unlike a big city some of Manhattan's shore line really is.

At 88th Street is Gracie Mansion, home of New York's Mayor, with its broad veranda facing the river. You can get an excellent shot of this beauty spot from the boat, but you will get a rather small image unless you have a telephoto lens. Incidentally, a telephoto lens will bring in many good shots from the boat that will be quite unimpressive with an ordinary lens.

At 125th Street you will pass under the Manhattan link of the Triboro Bridge, which is really a combination of three bridges with connecting elevated roadways all tied together on Ward's and Randall's Islands where more City institutions are located. This structure connects three of New York's five boroughs—Manhattan, Bronx, and Queens. Just beyond the Triboro Bridge is the famous Hell Gate railroad bridge.

The boat now enters the Harlem River which separates Manhattan from Bronx, and you sail under a number of bridges connecting those two boroughs. Some of these are good photographic subjects.

Near the upper end of Manhattan you will see the Sherman Creek generating station of the Consolidated Edison Company. This is by far the most photogenic of the several power houses that you can shoot from the boat, and there are no large structures around it.

As you swing around the northerly tip of the Island, New York's newest bridge comes into view. This is the high arch that carries the West Side Highway over the Harlem River. By way of contrast, one of the City's oldest bridges is just beyond. This is a small low structure carrying New York Central freight trains into Manhattan. It is the only one on the whole tour that is so low that it must be opened to let the sightseeing boats pass through.

At this point one of the most impressive sights of the trip unfolds—the majestic Hudson, with New Jersey's

(Turn to page 338)

GRADATION CONTROL

ROWLAND S. POTTER, FPSA *

Dr. Rowland S. Potter, FPSA, retiring after many years of valued service to photography, received a Special PSA Honor Award at the meeting of the New York Technical Section on January 8, 1952.

The citation read as follows: "To Dr. Rowland S. Potter, FPSA, for his years of faithful and outstanding service to photography in the fields of color processes and especially in the development and perfection of Varigam, the variable-contrast printing paper, and of the Aristo Grad-A-Con, the variable-color light source which completes the versatility and general usefulness of the paper."

Dr. Potter presented the following paper as the principal feature of a symposium on variable-contrast papers.

Webster's Dictionary defines "Contrast" as the opposition by comparison of qualities and "Gradation" as a stepwise progression.

Although practically all photographers use the word "contrast" to denote the steepness of the scale of tones between black and white, it is really a misnomer. The contrast between white and maximum black in all grades of photographic papers of the same surface is practically alike; however, the rate at which we progress stepwise from white to black with equal proportional exposure increments is markedly different. Soft grades of paper have many steps between black and white, the hard grades few. In this article we shall consider a paper to be of steep or hard gradation when equal proportional increments of exposure to light produce a rapid change (few steps) from black to white. Conversely, a paper will be of low or soft gradation when equal proportional increments of exposure to light result in a large number of steps from black to white. (Figure 1)

Figure 1. Top: Soft Gradation. Bottom: Hard Gradation.

The characteristics of a photographic paper are accurately determined by exposing strips of the paper stepwise to a series of proportionately increasing exposure intensities, each greater than the other by a factor arbitrarily chosen as the $\sqrt{2}$, from a standard light source used at a standard distance. A neutral density step tablet or wedge is normally used for this purpose. After the paper strips are exposed, developed, fixed, washed and dried, the

density (measured by the logarithm of the opacity or blackness) is plotted against each step (the value of which is expressed numerically by the logarithm of the exposure intensity). The curve so obtained (Figure 2) is the familiar H & D curve (so called in honor of Messrs. Hurter and Driffield who are properly considered the fathers of modern photographic sensitometry). This curve is also frequently referred to as the D log E curve.

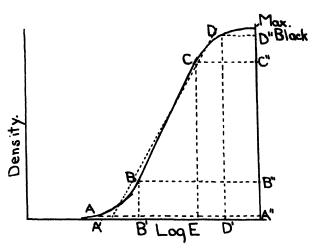

Figure 2. The H & D Curve.

The important photographic characteristics are illustrated or can be determined from the curve and are enumerated as follows:

- (1) The straight line portion BC.
- (2) The curved toe in the low exposure region AB.
- (3) The curved shoulder in the full exposure region CD.
- (4) The exposure scale which is measured between a point more or less arbitrarily selected near the beginning of the toe, A' and a point D', a projection from the point D more or less arbitrarily selected in the shoulder region onto the Log E scale.
 - (5) The density range, indicated by the distance A"D".
- (6) The gamma or steepness of gradation indicated by the straight line portion BC.
- (7) The gradation, illustrated by the dotted line EF, an attempt at averaging the slope of the more important or significant part of the curve. (The methods of doing this and their relative merits need not be discussed here.)
- (8) The speed, designated by a formula associated with a given point of density projected onto the Log E scale. Position D is usually selected.

Thus far we have discussed the background necessary for the evaluation of the characteristics of printing papers of varying steepness of gradation. We must next consider some of the characteristics of the subject being photographed. We shall consider three categories of subjects: (a) a studio portrait with a luminance range of 1 to 5, (b) an average amateur snapshot with a luminance range of 1 to 30, and (c) a beach or mountain scene with a luminance range of 1 to 1000.

^a Rowland S. Potter, FPSA, ACGI, Hon. Master of Phot. PAA, is a well known photographic consultant. He is a Charter member of PSA, has served as Director and First Vice President of PSA, was one of the initiators of the PSA Technical Division, and was the first Chairman of the Rochester Technical Section. He was formerly Vice President and Technical Director of Defender Photo Supply Company and was the originator of Varigam variable-contrast pager.

Neglecting for the moment the intermediate negative stage, let us consider the desirable or possible reproduction of such luminance range on our photographic paper. The darkest black of the developed image of the usual projection type paper, semi-matte or lustre surface, reflects about 1/30 of the incident light as do the whites. Should we expect to utilize the full black to white range of the silver deposit if the luminance range of the original is as low as 1 to 5? The answer to this involves factors of psychology, artistic appreciation and physics. In some cases we would prefer to use the full scale of the paper, opacity range 1 to 30, even though it results in a print of steeper gradation. This desire will generally manifest itself in photographs of poorly lighted interiors. In other cases such as high key portraits we shall doubtless desire to use only a portion of the blackness range of the paper. However, in the other extreme, a subject with a luminance range 1 to 1000 is obviously impossible to reproduce accurately on a paper with a reproduction scale of 1 to 30. We must, therefore, compromise by compressing our scale of tones to our actual limits or attempting to reproduce accurately only a portion or portions of the original subject scale. If we attempt in practice the complete compression to secure detail in every part of a long subject range, a print will result that will be universally criticized as flat and mushy. The alternative is to reproduce only certain parts of the scale (for example, the shadow areas) and to deliberately "print in" other regions so that these areas may also be well rendered. It is well known that most people will accept without question the inaccurate relationship of one fairly large area to another, but not the accuracy of rendition in these areas (bright sunlight and large shadow areas). A compromise is in most cases the acceptable solution.

Let us now briefly consider the negative. Most well exposed negatives do not cover the shoulder region, and the gamma or slope of the straight line portion of the curve does represent the gradation. Figure 3 represents a D Log E curve for negative materials. Negatives of the same subject can and often are developed for different lengths of time and in developers of varying chemical compositions resulting in negatives of different gradation (gamma) and density range.

Negatives of varying density range may be due to degree of development (gamma) or to subject luminance range.

At first glance it would appear obvious that we could obtain the most acceptable print by selecting the grade

of paper with exposure scale A'B' (Figure 2) as near as possible to the density range of the negative to be printed. However, this assumption is fallacious.

Let us conceive of a subject which conveniently splits itself into two parts occupying, for example, when photographed, the two halves (A and B) of a 5" x 7" film. The A half of the subject has a luminance range of 1 to 30 whereas the whole subject A + B has a luminance range of 1 to 1000. Many subjects fall into this category, but may not be so easily separated into sections A and B. If we expose and develop as a unit, we can print and evaluate portions A and A + B.

Let us assume that we develop to a gamma (possibly 0.7) so that the negative density range in A will require a #2 grade paper to give a good print of clean highlights and good blacks. Considering the negative as a whole, A + B, the longer density range will call for a softer grade of paper by the criteria outlined above. A print on a soft grade of paper will result in the A portion being soft and mushy. If we print the whole negative A + B on the same grade as for A and expose for the A section, the B section will be underexposed. If we print for section B, section A will be "burnt up". A good printer will obtain the best print by using the grade of paper selected for A and covering A while additional exposure is given to B. However, it is occasionally true that a pleasing print may be obtained with a single exposure on a slightly softer grade of paper, say something between grades 1 and 2.

Paper Selection from Negative Density Range

With negatives of subjects with a luminance range not exceeding 1 to 30 (the range from black to white of the printing paper), the grade of paper desired may be fairly accurately selected from the negative density range. It should be clearly noted that with negatives of aerial views, where true gradation rendition is of less importance than delineation of detail in both highlights and shadows, the negative density range is an excellent criterion for printing.

It is a well known fact that the same emulsion coated as glossy, semi-matte and full matte will, when tested, show practically the same log E scale, but will differ in gradation and maximum black. The most acceptable print on the glossy surface is obtained from a negative of softer gradation or lower gamma than one resulting in an

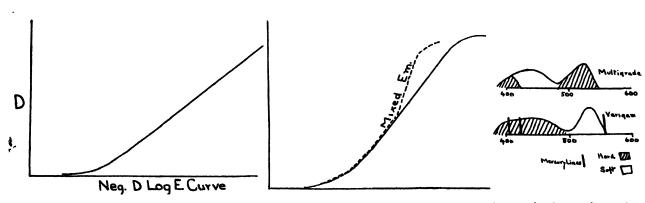

Figure 3.

Figure 4.

Figure 5 (top) and 6 (bottom).

acceptable print on a full matte surface (same subject, of course).

In the monumental and laborious work of L. A. Jones and his co-workers, it has been clearly shown that first choice prints have been obtained, at least on grades 1 and 2, from negatives some of whose density ranges were more than double others. First choice prints have also been obtained from negatives of exactly the same negative density range on grades 1, 2 and 3 of paper. Hence there are clearly other and perhaps more important factors than negative density range in selecting grades of printing paper. These factors include luminance range of subject, gamma of negative, and an aesthetic approach in print evaluation (all factors may be only in part available to the printer).

This long preamble has been necessary to establish that the need for a variety in steepness of gradation of printing papers is not an admission of poor technique but a necessity born of trial, error and experience to satisfy the critical judgment of a good printer.

The maker of good prints has also frequently been called on not only to expose certain areas of his negative more than others but also to try to obtain different gradations in certain areas, for example, to print shadows softer or harder than highlights.

Control by Manipulation

The next point of discussion is the method of obtaining and controlling the desired variation in gradation or gradation control. A look into the history of gradation control reveals that in the early days of projection papers, such papers were manufactured in one gradation only, subsequently termed "normal". Some control of steepness of gradation was available by one or more of the following methods:

- 1. Over-exposure and short development gave softer gradation. Under-exposure and prolonged development gave a harder gradation.
- 2. Changes in developer formula such as ratio of metol to hydroquinone, proportion of bromide, variations in pH (alkalinity) yield gradation changes.
- 3. Developer concentration—a concentrated formula will usually give a steeper gradation and a diluted formula will give a softer gradation.
- 4. Use of reducing agents other than metol and hydro-quinone.

To get the best possible print from a negative has usually meant a lot of "jiggery-pokery". To reduce these complications, manufacturers added other grades than "normal", usually designated by such terms as "soft", "medium", "hard" and "extra hard", but there were still a great number of cases when intermediate gradations were required causing the expert printer to still resort to variances in technique. It would not be entirely fair here to neglect mechanical or optical methods of limited control using accessories or different types of enlargers, a condenser type enlarger will give a steeper gradation than an enlarger using a diffuse light source. Other and more complicated methods such as masking have from time to time been suggested. Obviously there is a demand for simplified gradation control to produce first class prints.

In 1912, Rudolph Fischer was granted a patent, the importance of which was not adequately recognized at the time. He suggested coating a base with a soft emulsion and superimposing on this a hard emulsion sensitized to green light, or vice versa. A combination such as this, if suitably balanced, would give a hard gradation when exposed to green or yellow light and a soft gradation when exposed to blue light. Fischer's patent also claimed the use of mixed emulsions, but the procedure did not result in successful application in practice. The reasons for this lack of success were probably many. For example, it is difficult to mix two emulsions of widely different gradation, both normally sensitive to blue light, without encountering the problems of broken sensitometric curves (Figure 4), the choice of sensitizing dyes was not large and the problem of dye migration probably plagued him, the lack of an adequate set of control filters and the inertia of a smaller photographic market of that day.

There was little further progress until 1940, when two new gradation control papers were announced. Ilford Ltd. of England introduced "multigrade" made according to the patents of F. F. Renwick, Ilford's director of research. "Multigrade" like Fischer's product was a mixed emulsion, but Renwick used a steep gradation chloride emulsion, normally only sensitive to violet light. which he sensitized to green light and a soft gradation blue light sensitive bromide emulsion. So low was the chloride's emulsion sensitivity to violet light compared to the bromide emulsion sensitivity in the blue-violet region that for all practical purposes each emulsion was sensitive to entirely different spectral regions. This overcame the sensitometric deficiency of the Fischer product (Figure 5). In the same year, the writer, then Research Director of Defender Photo Supply Co. of Rochester, N. Y. originated an entirely new type of variable gradation paper later known as "Varigam".

Difference of Varigam Emulsion

The methods hitherto discussed depended on mixing two emulsions of different optical characteristics. Varigam, however, is based on so treating a single, steep gradation emulsion that certain of its individual grains were made more color sensitive than others. The important theory behind the Defender process is not revealed in the patents and need not be discussed here.

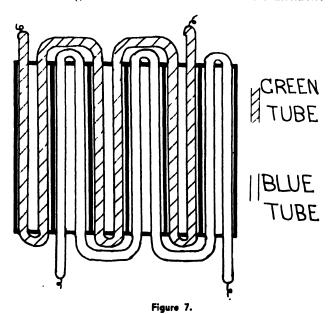

This method avoided the shortcomings of the Fischer product. Exposure to blue light resulted in prints of hard gradation and exposure to green or yellow light prints of soft gradation (Figure 6). The sensitometric curves for all contrast grades were satisfactory and free of irregularities. The image color of both hard contrast and soft contrast prints were similar since only one emulsion was used. The name "Varigam" was derived from variable gamma or gradation.

For a few years there was considerable patent activity in this field. Renwick and Waller in England and Carrol in the United States found another method of controlling the optical characteristics of the grains of a single emulsion by optically sensitizing a portion of the finished emulsion and mixing before coating. Knott of Kodak has patented a variety of mixed emulsions of narrow

sensitometric and color sensitive specifications. To date, however, Varigam is the only product on the American market.

In the beginning, two methods of control were available: (1) a two filter technique involving a partial exposure through a blue filter and the remainder through a yellow filter. This method involved considerable difficulty in calculating relative exposures especially when fractional changes in overall exposure were indicated. The two filter technique has other failings which may be visualized by glancing at some of the final paragraphs of this article. (2) Messrs. Harrison & Harrison of Los Angeles in cooperation with Defender produced a set of ten glass control filters requiring approximately similar exposures. The filters were satisfactory but expensive which created considerable sales resistance.

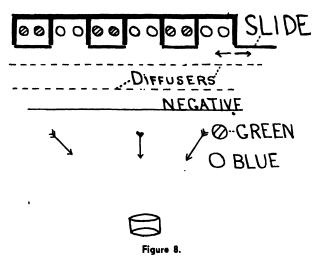

Shortly thereafter, Defender began producing a similar set of ten gelatin filters. These were adjusted for use with the average type of tungsten light source of most enlargers and required nearly uniform exposures throughout, except for slightly longer exposure when extremely hard gradation prints were required. Defender pioneered with a protective lacquer coating of the gelatin filter, and mounted them in black card mounts suitably labeled. The sets were supplied at nominal cost in a kit provided also with a filter holder attachment fitting practically all enlarging lenses. The reaction of users to these filters was encouraging. Many thousands of these sets were sold and are in use, but they are subject to damage by dust, chemical splashes, finger marks or warping. The changing of filters was considered a nuisance; individual filters would become misplaced, damaged or lost; and oftentimes gradations between two filters were desirable.

Many devices have been patented for simpler gradation control than by use of a set of filters. Some of these were very promising. Simmon Brothers, of enlarger fame, holds a number of such patents, but for one reason or another, none of these devices have yet reached the market.

The ground work for elimination of these undesirable characteristics was laid by A. Azan of the Aristo Grid Lamp Co. who developed and successfully introduced a

grid shaped, cold cathode, fluorescent lamp for a light source in photographic enlargers. Simple but adequate diffusers made this an excellent light source, it being cool and free from so-called hot spots. In the early part of 1951, it occurred to the writer to use two such light grids intermeshing with each other as a light source for Varigam paper (Figure 7). In one of these grids a suitable phosphor was to be used fluorescing in the blue region, predominantly between 4000 and 5000 A°, to obtain steep gradation with Varigam and in the other grid a green fluorescing phosphor, predominantly in the range of 5000 to 5600 A° for soft gradation. The folds of the green fluorescent tube are completely separated from the folds of the blue tube by opaque partitions (Figure 8). These folds are contained in separate compartments open only on the side facing the negative. In front of these compartments is an accurately made slot type shutter of equally spaced opaque and clear areas running parallel to the compartment separations. The shutter is capable of smooth and easily controlled motion transverse to the slots and to the extent of one complete compartment.

When the shutter is at one end of its transverse motion, green light only is emitted. At the other end only blue light is emitted. At any other position of the shutter, fractions of each light are emitted and any ration of blue to green light can be obtained. The shutter is conveniently attached to a dial which is graduated for simplicity in ten equal units across the scale so that any control position can be used. To complete the light, diffusers are placed at suitable distances between light tubes and negative.

Mr. Andrew Azan of the Aristo Grid Lamp Co. built the first lamp drawing upon his extensive knowledge of cold cathode fluorescent light sources. Since any ratio of blue to green emission can be obtained by simple movement of a control lever, the steepness of gradation exactly follows this ratio and any desired gradation between soft and hard is obtainable.

Because the phosphors in each tube are activated by a mercury arc, all the spectrum lines of mercury are emitted by each tube. The mercury line at 5461A° will be visibly present in the blue tube and the lines at 4047A° and 4358A° will be visible in the green tube. These lines, of

of sufficient practical disadvantage, can be eliminated by coating the tubes with suitably tinted lacquers.

The photographic response to the blue light can be balanced with the green response so that each color will require approximately the same exposure with Varigam paper.

The light unit consists of a power pack separate from the lamphouse and connected to it by a cable. The burning life is estimated at 4000 to 6000 hours and the wattage of the 8" x 10" size is 150. The lamp's effective power is approximately four times that of ordinary tungsten light. The light output will drop 20% in the first one thousand hours and then remains nearly constant throughout the remainder of its life.

The new unit has been named "Grad-A-Con".

Though the scale on the unit is marked from 1 to 10, these numbers denote only setting points for an infinite gradation control and have no association with the arbitrary grade numbers of papers of different manufacturers. The user soon learns to think of scale setting rather than grade number.

Control Possibilities

There are three distinct types of gradation control possible with this unit, their importance having already been made clear.

- Gradation Selection. Any gradation can be selected at will without reference to grade numbers.
- 2) Local Gradation Selection. Selected areas of the negative controlled by suitable opaque masks can be printed at different steepness of gradation.
- 3) Overall Gradation Control. For example with vigorous negatives with detail in both shadows and highlights, sufficient overall exposure can be given to nearly print the shadows at a steep gradation and then complete the exposure at a soft setting to secure highlight detail without spoiling the shadows. Bride and groom pictures frequently come in this category.

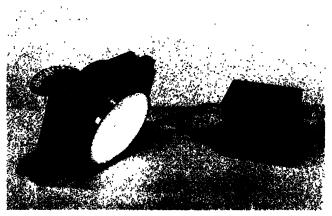

Figure 9. The Grad-A-Con Unit. Photo courtesy "Photography."

In General

This complete gradation control is equally valuable to commercial, professional and amateur alike. The simple toning formulas published for Varigam give wide choice for warm tone portraits and salon prints.

By using the unit at the blue end, the "Grad-A-Con" is equally suitable for normal projection papers, and a setting is easily found for warmtone papers, but, naturally, there is no gradation control with this type papers.

Now that gradation control is so simple there will doubtless be other manufacturers of variable gradation papers. There is no reason why warmtone papers cannot also be made with variable gradation characteristics.

Conclusion

Thus at long last both amateur and professional photographers no longer have to stock many grades of paper but can by manipulating a lever secure all desired gradation control.

Camera Club Manual

Chapter IV Continued

Selecting Camera Club Activities

The following list of activities, while comprehensive, still is incomplete. All activities listed have been tried and found practical. Any activity listed may be, and probably should be, modified or adapted to the interests, needs, and resources of a club.

1. Field Trip Activity

There is considerable difference between outings, field trips, and picnics. The latter have little place in camera club activities because their chief concern is food and play, with camera taken along "just in case." Better leave picnics to family groups, social clubs, etc.

Photographic outings differ from picnics in that the purpose is photography, with food and play secondary. These have some justification in club activities occasionally but tend to gradually deteriorate because eating and playing are so much easier than creating.

The field trip's purpose is serious photography and has an important place in any well rounded club program. An instructor or guide is provided, picture problems are discussed, and various methods and approaches to each problem are suggested. On such a trip there will be joking and laughter, but not too much "playing" and the food is quite secondary, perhaps a couple of sandwiches in a side pocket and a drink from a lake or stream.

Field trips ordinarily are made to the open country for pictorial photography, but may be held within the community which offers opportunity for pictorial, architectural, candid, news, and other photography. The extent of the trip depends upon the interests of the members and the time available. A local field trip may be made within an afternoon. A distant field trip may occupy a week-end.

First essential is that the field trip be properly organized, a requirement easily met by establishing a Field Trip Activity. The director preferably should visit the locale in advance and study the possibilities. Besides obtaining permission for photography, he should ascertain possible pictures, make a time record of the lighting, arrange for any such features as model service, check transportation details, and otherwise make all preparations so that members are neither annoyed, delayed, nor inconvenienced. Announcement of the trip should include a time schedule indicating transportation and eating accommodations, places to be visited, pictures available, special attractions, and times of arrival and departure.

Ideal locale for a country trip is a farm. Here picture possibilities are concentrated, and the long walks which occupy time and tire the photographers are avoided. Accommodating farmers usually will permit club members to photograph barns, stock, and views about the premises. If the club members agree to make up a book of prints of pictures taken on the farm and present it to the farm family, the way to subsequent visits will be opened. Older farms abound in picture possibilities, including the farm animals and pets.

Field trips to small parks are productive. Permission to take photographs in the park should be obtained in advance, if only as a courtesy to the custodians and as a means of obtaining information about the access to places from which the public may be barred. City parks, if carefully selected, are satisfactory for limited-time field trips. Zoos are excellent, but advance contact with the management should be made.

The field trip within the community should be planned as carefully in advance as the country journey. Members should be notified of time and place of assembling, given full outlines of picture possibilities, and warned of traffic dangers and of respect for private property. Older sections of cities usually are photogenic. If an informed guide can be obtained, the trip can combine history and photography.

Field trip directors should plan to give club members plenty of time at each selected picture spot, and should keep the club members together in their travels. At noon the trip should lead to the vicinity of an eating place, or to a picnic ground where lunches may be enjoyed.

Field trip expenses should be kept to a minimum. Experience indicates that \$2 trips are the more popular, with \$5 trips close to the economic ceiling. Amateur models may be induced to go along and to accept payment in finished prints. Professional models may be employed, with the fee shared by all participants. Locale of the trip will decide whether the models should take costumes.

Visits to historic spots, to picturesque small communi-

ties, and to institutions are possibilities. Interests of club members, if surveyed, will reveal others. It would contribute to photographic experience and ability were a club to make a field trip a photographic project, such as preparing a series of pictures of a small college campus, or preparing completely descriptive picture sets of historic spots. Visits to the same locale in spring, summer, fall, and winter afford variety without being boring.

Several clubs may combine for a field trip, although 20 photographers is about the maximum for a single director.

A "field trip book" should be maintained by each field trip director. In this book should be a section for each trip taken by the club. It should include a map, complete information on transportation, highway routes, location of closest restaurant, if any (in cases of state parks, etc.), a general description of photographic possibilities and areas, and a series of snapshots from previous trips to the same area. Such a book will save much repetitious discussion by members when planning future trips and will be a valuable portion of club historical records.

2. "Home Town" Project

Many clubs have attempted the "home town pictures" project. Few of these have ever been completed.

They fail for two reasons. First, the incentive is not sufficiently challenging to the photographer who wants to create rather than merely "record." And even when there is sufficient enthusiasm for a record type of project, failure results when mechanics of the project are poorly organized.

The answer to the first is to make the project challenging, to require that the pictures, though factual, must also be pictorial. This means that they must be able to win prizes in competitions or acceptances in national exhibitions. It means that the postcard type of picture is not enough. It means that the home town must be seen with imagination and artistry.

Picture Main Street? Yes, but maybe when the sun makes golden threads of the street car tracks. Picture the court house? Yes, but maybe when a storm sky is its background while it yet is in the sun's rays. A park picture? Yes, but maybe when the trees are silvery laced with ice. A picture of the highest building? Yes, but maybe at an angle which makes it a composition in lines and shadows. "Pictorial, yet factual" should be the theme.

The organization of the project also has much to do with its success. It is better not to approach it in a general way as something which it is hoped members will support, but to organize it as a definite, responsible unit with dues and meetings of its own till completion of the project.

This unit, which might be called the "Project Group," should include competent workers though all members should be welcome. At least a year should be planned for completion of the project because this period will cover four seasons, enabling a full cycle of study of viewpoints for selected subjects.

Annual dues in the group should consist of 5 prints, or slides, which are acceptable for the final set. It probably will be necessary to submit a much higher number in order to meet this, but all non-accepted pictures would be returned. (Turn to page 338.)

Estimating Exposure for Movie Film Outdoors

JOHN DEBES *

SHOOT FIRST; ask questions later! Sounds like a horseopera law of survival, doesn't it? Actually, it's a pretty good rule for home movie making too. Shoot first? Yes! Any home moviemaker, worth his film, knows he has only one good chance to get his pictures. Unlike the professional motion picture photographer, the action he films is never run a second time for the benefit of the camera.

Ask questions later? Yes! Since you don't usually have time to hold a conference with yourself before you shoot a scene, there is only one intelligent thing to do: analyze the results. In other words: ask questions later.

Every home movie maker knows that nothing so drastically affects the quality of his pictures as exposure. And, since setting the lens opening is his principal means of controlling exposure, setting the lens opening always has a certain feeling of finality and excitement about it. Once you set the lens opening, the die is cast. The impression caught on the film is as irrevocable as the "moving finger" of the Rubiayat. That lens opening must be about right each time you shoot, or the scene is lost forever.

Yet, the setting of the lens opening cannot be regarded as a hazard to be surmounted only with difficulty. In

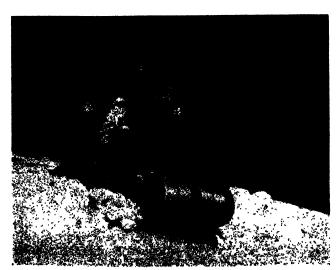

fact, good movie makers know that some of their best shots are those caught on the spur of the moment. To be able to catch such scenes, they must be able to set the lens opening correctly almost automatically. To do this calls, first, for a good understanding of the relationship between light conditions and lens apertures needed for good exposure; second, for practice in using that knowledge.

All this sounds as if the correct aperture were a slippery little fellow always hiding in dark corners behind exposure meters, guides and tables. Most of the time, fortunately for most home movie makers, this is far from the truth. The fact is that 75 percent or more of all home movies are made in bright sunlight of front-lighted subjects. The exposures for such situations are so standard, and so well publicized by film manufacturers, that no one need go wrong.

Unfortunately, if you are a fairly regular movie maker, you are constantly being driven to making pictures under conditions other than average. You can't always wait for a sunny day. Aunt Hattie is here today and gone tomorrow. Or, your artistic soul demands some special lighting effect to give your pictures that certain Cine-quanon.

Uttarpara

* Eastman Kodak Company, Rochester 4, N. Y.

Light Subject: White snow, average to light clothing, and a fairly wide arc of sky make a combination definitely brighter than average. For front lighting on Kodachrome Film Daylight Type, set lens between 8 and 11.

Calkrishna Public Library

Extremely Light Subject: White sand, fair complexioned people, sunlit water, and a very wide arc of sky—all bright—make up a subject very much brighter than average. For front lighting, on Kodachrome Film, Daylight Type, use f/11.

PSA JOURNAL, Vol. 18, May 1952

Dark Subject: Dark uniforms, relatively dark fall clothes, average grass, and only a few light areas make this subject definitely darker than average. For front lighting, set the lens opening between 5.6 and 8. This is side-lighted so use 5.6.

Meters

There are a great many situations in which the light is unpredictable. Late in the day, early in the morning, or under porches or trees, for instance, no standard exposure recommendation is safe and a meter reading is the only reliable information on which a lens aperture setting can be based. So, if you have time to take out your meter and use it, by all means do so. Most times, however, the fire engine won't wait, the dog will finish the ice cream cone, or the baby's expression will have changed from smiles to squawls.

This doesn't mean that a meter is useless. When you have the leisure, there is practically no better way of improving your ability to judge exposures than to go about taking meter readings and figuring exposures for places in which you may be shooting pictures sometime in the future. For instance, let's say you are on a picnic. The gang is playing ball and you have just taken some shots of that. You know you will also want to film them eating. The picnic table is in the shade. Why not take the meter readings when you have ample time?

After you have determined the exposures, if you are forgetful, you might jot them down on a piece of adhesive tape. This piece of tape, stuck on your camera, will be ready, willing and waiting with the information when you need it.

But when you are filming a scene, you need to know at once what lens opening to use. Most times you can know it simply by keeping firmly in mind some simple system of relationships between the intensity of the light and the lens apertures necessary for correct exposure. One such system is explained below.

Film

Basic to an understanding of outdoor exposure are a we facts about film. Home movie films are of the reversal type. From the point of view of correct exposure, the important thing about this is that it is highlight detail that you must aim at. When taking still camera pictures on negative films, you try to shoot to get detail in the

shadows, or the darkest parts of scenes. These are the parts of the negative that appear most transparent when examined by transmitted light. Since reversal films are viewed as positives by transmitted light, it is the highlights, or the bright parts of the subject that are most nearly clear. Properly-exposed reversal films should contain discernible details in the high light areas.

You do not need to concern yourself with the grain, speed, resolution, or any other qualities of the film you use. Manufacturers of movie films have designed those films to be satisfactory for all reasonable home movie requirements. In fact, most home movie films considerably exceed in their qualities anything that the average home movie maker should reasonably expect of them. You should, therefore, try to use the film the way the manufacturer says it should be used. This means, for one thing, that you should not just throw away the instruction sheet that is packed with the film. It is always wise to check this sheet, to see what the manufacturer is saying about the product and its use.

Subjects

Exposure depends partly upon how much of the light that falls upon a subject, is reflected by that subject into the camera lens. Probably 80 percent of the subjects home movie makers film are average in their reflecting characteristics. Of the remaining 20 percent, about half are lighter than average, and about half, darker than average. A subject generally light in color will reflect a greater amount of light into the camera lens than a subject average in color. A subject dark in color will reflect a smaller amount of light into the camera lens than a subject average in color.

To take some rather extreme examples, a snow scene, including people in white parkas, if exposed as an average scene, would tend to be overexposed because of the large amount of light reflected by the snow and white clothing. On the other hand, a scene including spruce trees, and people in dark clothing, would tend to be underexposed because of the small amount of light reflected by these dark subjects.

Because a light subject does reflect more light into the camera lens than an average subject, it is necessary to use a smaller lens opening for a light subject than for an average subject. Contrary-wise, since a dark subject reflects less light into the camera lens than an average subject, it is necessary to use a larger lens opening than for an average subject.

The degree of compensation depends to some extent on the film. With Kodak Super-X or Super-XX Films, for instance, compensations in the development process make it unnecessary to make an allowance for subject type unless the scene is extremely light or extremely dark. When an allowance is made, it is generally of the order of a full stop smaller for a light subject, and a full stop larger for a dark subject.

Color films, however, have less exposure latitude than black-and-white films. They, therefore, demand a fairly careful adjustment for subject type if over- or under-exposure is to be avoided. For generally light subjects, a lens opening one-half stop smaller than for average subjects should be used. For generally dark subjects,

the aperture used should be one-half stop larger than

for average subjects.

Typical light subjects are beach scenes, snow scenes, light-colored arid areas, light-colored stone buildings, large paved courts of white stone or comparable materials, and nearly all yellow or white flowers in close-ups. Dark subjects include trees, gardens in which bushes and trees predominate, people with dark complexions, dark-colored clothing, and small bodies of front-lighted water, especially when surrounded by dark trees. Average subjects, fortunately for the movie maker, include almost everything else.

There are some extreme subject types that call for more than one-half stop of correction for color film. This is most frequently the case when all the principal parts of the scene are of the same extreme type. For instance, if there are no people or things prominent in the scene, backlighted snow or water are so brilliant in bright sunlight that a full stop correction is needed (f/11). Darkhaired animals against dark-foliaged trees may need an aperture a full stop larger than average (f/5.6).

There is room for discretion in the choice of subjects by the movie maker. It is a good idea to bear in mind that some scenes are extremely contrasty and call for every ounce of latitude the film contains. It is almost impossible to photograph a black cat against a white background and have good detail in both the dark fur of the cat, and the white background. The brightness range of such a subject is just too great. The astute movie maker, therefore, tries to select his subjects and background material so the brightness range is not excessive. Smart tactics in the above case, for instance, would be to use a medium gray background and use the white background as a reflector, just out of the picture, to throw additional light into the murky shadow areas of the cat's fur.

Your subject is what you are trying to photograph. This seems obvious and even a little silly phrased in just this way; however, over- or underexposure sometimes results from people not understanding this principle. To illustrate: let's assume that our black cat against the white background was the subject being photographed. The background was not of principal importance. The exposure, in such case, should be based on the cat and not the background.

A common error of movie makers is to photograph a snow scene with people close enough to fill the view finder as if it were a snow scene pure and simple. Basing their exposure on a snowy landscape, they class the scene as a light subject. What they are really interested in is the people in the scene. These people are not light subjects, but average subjects in light surroundings. The smart movie maker would shoot them as average subjects, counting on the snow to give him extra reflected light and thus better exposure in the shadow areas.

Sunlight and Daylight

The author of "The Sun Is My Undoing" might have been speaking for movie makers. Sunlight is not an unmixed blessing. As long as a movie maker sticks to front-lighted (sun in back of camera), sun-lit subjects, he is bound to have good results exposure-wise. But, no

Average Subject: This is a typical medley of light, dark and average tones—in other words, an average subject. Like most front-lighted, sun-lit subjects this should be filmed with the lens opening set at 8, if you are using Kodachrome film.

home movie maker worth his salt is ever satisfied with this kind of lighting. What about side-lighting, backlighting, hazy days, cloudy days, and shaded subjects?

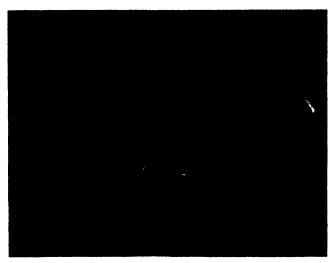

Let's take principal sky conditions first. It has been found convenient to divide sky conditions into four groups. These are clear sun, hazy sun, cloudy-bright and cloudy-dull. In terms of lens apertures, they are one stop apart. In other words, if the correct exposure for Kodachrome film, daylight type, on a bright sunny day is 1/8, the exposure on a hazy day would be f/5.6, on a cloudy-bright day would be f/4 and on a cloudy-dull day would be f/2.8.

Clear sun, means a blue sky with few or no clouds. Hazy sun means a light, white overcast, or such lightly clouded conditions as give definite, but faint shadows. Cloudy-bright, means a bright white sky, but so completely clouded that the sun is only a slightly brighter spot in the sky. However, no shadows would be discernible. Cloudy-dull means that the sun is heavily obscured and the rest of the sky a light gray rather than white (looks like it might rain).

For the technical-minded folks who prefer scientific measurements, the four classifications of sky conditions rate something like this: On a clear, sunny day, the combination of sunlight and skylight on a subject would be of the order of approximately 10,000 footcandles; on a hazy day of the order of 5,000 footcandles; on a cloudy-bright day, 2500 footcandles; on a cloudy-dull day, 1200 footcandles.

Clear, sunny days set a small and sometimes nasty handful of problems when the movie-maker leaves the safe highway of front lighting for the more intriguing byways of side or back lighting. It's the high relative intensity of direct sunlight to skylight that causes the difficulty. This high ratio sets up a brightness range that may exceed the latitude of the film, depending on the subject. Even when it doesn't, a balance such as 3 or 4 to 1 gives a much more pleasing result.

Seen side-lighted, a sunlit subject resembles a halfmoon. On the sunlit side, the intensity may be over 10,000 foot-candles. On the shady side, illuminated

Extremely Dark Subject: Dark clothes, dark surroundings, and only a few small areas average or light in tone make this subject very much darker than average. For front lighting, use f/5.6. For side-lighting like this, use between 4 and 5.6.

solely by skylight, the intensity may be as low as 1200 foot-candles. The ratio may be 8 or 9 to 1.

Few subjects will record well at this ratio. Expose for the highlights and the shadows will tend toward under-exposure; expose for the shadows and the highlights will tend toward overexposure. Generally, the best course is to ride both horses. Experience has shown that setting the lens opening one-half stop wider than for front lighting results in better exposure in the shadows while not excessively overexposing the highlights.

Back lighting, especially for close-ups of people in color, can give beautiful effects because the lighting is uniform. The combination of skylight and sunlight reflected back into the shadows from the surroundings varies in intensity. Here, experience shows that setting the lens one full stop wider than for front lighting is best for most situations.

There is one more category of outdoor lighting that needs discussion. Shade is a popular place to take pictures. On color films especially, the soft, slightly-bluish lighting is something many people find quite pleasing. The type of shade for which an exposure recommendation can be made is open shade. By open shade it is meant, shade next to relatively low objects that permit a very large area of the sky to illuminate the subject.

The shade between trees, under porches or between high buildings is unpredictable, and will vary according to the heights of the trees, the closeness of the buildings, or the wideness of the porches. No firm recommendation can be given for such situations, and generally, for Kodachrome film, the lens opening needed will be f/1.9 or larger. So, it's best to use a meter, and, if possible, to evaluate the meter recommendation by checking it against experience gained filming similar spots.

Adding It Up

Having covered the principal conditions affecting exposure outdoors, how can we use this information to arrive quickly at correct exposure for a scene at the very moment we need it? About the easiest way to do this is to memorize the average-subject-direct-sunlight exposure for

the film you use most of the time. From that firm point, by keeping in mind the system of adjustments for the successively dimmer light and sky conditions, for side-and back-lighting, and for subject type, you can figure quickly the correct exposure for most outdoor movie scenes.

Assuming you are using Kodachrome Film, Daylight Type, the one stop steps for sky conditions (average subject) look like this:

Sunlight f/8

Hazy Day — 5.6

Cloudy Bright — 4.

Cloudy Dull — 2.8

Next, if your subject is in sunlight, keep in mind that the correction for side-lighted subjects in sunlight is one-half stop and for back-lighted close-ups in full sunlight is one full stop. If you use one film, like Kodachrome Film, Daylight Type, all the time, then the relationship you should bear in mind is as follows:

Average Subject in Sunlight
Front-lighted — 8
Side-lighted — between 8 and 5.6
Back-lighted close-ups — 5.6

Finally, as an adjustment for subject type, keep in mind that light subjects under all conditions would be exposed with an aperture one-half stop smaller than the recommended table above for average subjects. The lens apertures for dark subjects would be one-half stop larger. The rare, extremely light subjects call for a full stop smaller, and the even rarer, extremely dark subjects, one full stop larger. The easiest way is to mentally make the adjustments for sky condition, and, in the case of sunlight, for the light direction, on the basis of your subject being average. Then, simply open up, or close down a half or one stop, depending on the lightness or darkness of your subject.

To illustrate the use of this method: you want to film on Kodachrome Film, a late summer flower garden. It is a dark subject. The day is sunny and clear, and you have decided to use side-lighting. Basic exposure for sunlight is f/8. For sidelighted, open up $\frac{1}{2}$ stop (f/5.6-8), for a dark subject, open up $\frac{1}{2}$ stop more (f/5.6). Correct aperture: 5.6.

Another example: you are on a white sand beach. The sky is hazy but the sun is bright enough to cast faint shadows. Basic exposure for sunlight is f/8. For a hazy day, open up one stop (f/5.6). For a light subject, close down $\frac{1}{2}$ stop (5.6-8). Correct aperture: 5.6-8.

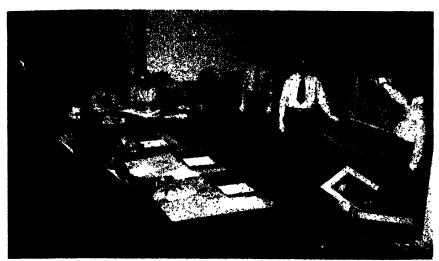

Once you have committed to memory the correct sunlight lens opening for your favorite film, you will probably find the rest of the structure easy to use. After you have it firmly in mind, and have a little practice in its use, you need no longer depend upon a meter. For most of the situations in which you take movies, this system provides you with an immediate answer to the question "What aperture should I use to expose my movie film correctly?" Then, you can "shoot first," with some confidence that you will be shooting right.

Pictorial DIGEST Division

Devoted to News of the Pictorial Division of the Photographic Society of America

The judging arrangements at the February 1952 PSA International Print Competition held at the Kodak Camera Club (Rochester, N. Y.). The print in the viewing box is "The Queen Arrives" by John Applegate. From left to right (excluding judges) are: R. R. Beyer, Grant Haist, Doris Sime, Joan Mallaber, H. Russ Boynton, Fletcher Brothers, Rodney Perry and R. Speck. Judges: John Mulder, Eugene Sourla, Lowell Miller. Photo by G. L. Austin, Jr.

INTERNATIONAL CLUB PRINT COMPETITION

By ROBERT J. LAUER, Director

THE RESULTS OF the February print competition for camera clubs held at Rochester, N. Y., found the top clubs retaining their first place positions. In class A, Oakland maintained first place with a total score of 247 points, and in class B, the Mission Pictorialists with 232 points. Both of these clubs have placed first in the bimonthly competition two out of three times. Trophy winners were Baltimore Camera Club, class A, and Mission Pictorialists, class B. These clubs earned high scores in the judging in their respective classes.

Although last month it was mentioned that the results of the April competition would be the first of the season to include the judges' ballot, this fact moving Kodak Camera Club, which sponsored the February contest, came through with a very fine ballot which included judges' comments.

FISHERMAN H. Waff

The jury featured three of the Rochester arca's best judges: John Mulder, FPSA, Hon. PSA, past president of PSA and Kodak CC and photographic lecturer and author; Lowell Miller, photographic lecturer and author; and Eugene Sourla, Rochester "Times Union" newspaperman and former photographic lecturer.

A total of 243 prints were received from 61 clubs, including entries from Canada. Cuba, and India. The receiving, separating, and handling of the prints was done in the same manner as in a regular international exhibition. After the judging, score sheets and judges comments were sent by first class mail to each club.

Grant M. Haist, chairman of the Monochrome Section of Kodak CC, has this to say regarding the competition:

"An analysis of the comments indicates that while the general level of technical quality of the prints was good, the level of originality and suitability of subject matter was below average. The judges

PORT Fred Kuehl

remarked on the exceptionally high quality of some of the entries from India and Cuba. Written comments indicate that minor changes in some of the prints would lead to greatly improved treatment. The judges were unanimous in their selection of the first and second place medal winners, but found the choice for third a very difficult one to make."

This judging was scheduled as a regular meeting of the Monochrome Section of Kodak CC. All area camera clubs were sent invitations to attend. Arrangements were under the joint direction of Grant M. Haist, and Sydney E. Anderson, Executive Secretary of the Club.

Individual winners were as follows:

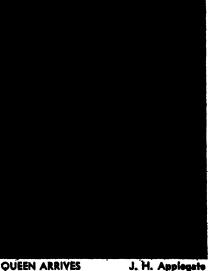

FIRST PLACE-"The Queen Arrives" by John H. Applegate, Grosse Pointe Camera Club.

SECOND PLACE-"Port" by Fred H. Kuehl of the Rock Island Camera Club. THIRD PLACE "Fisherman of Ianitzio" by Hugh Watt of Lawson Camera Club.

(According to points, there was a four-way tie between Watt, Eugenia Buxton of Memphis, Juan Fernandez of Cuba, and Delbert Pidgeon of Bartlesville. This was broken by the judges, and Hugh Watt was awarded the medal for third place.)

The top ranking clubs as of March are listed below. Next month a complete listing will appear. The fifth and final competition of this season is being held this month under the direction of the Fort Dearborn-Chicago Camera Club.

CLAS	S A	
Club	Feb. Score	Total to date
Oakland Camera Club	79	247
Baltimore Camera Club	93	232
Photo Guild of Detroit	88	227
CLAS	S B	
Mission Pictorialists	88	233
Atascadero (California)	76	204
Bartlesville Camera Club	74	196

STANLEY D. SOHL, Associate Editor

Everyone strives to increase their pleasure and so pictorial photography, especially the International Portfolio activities, offers no exception to the old saying that "One gets out of a project benefits in proportion to the effort put into it." This is certainly true in portfolio activities on the international level and the chance to study, to analyze prints, to evaluate and comment on them, and to gain a certain understanding of our friends, is something that increases the pleasure of the experience.

Everyone wants to get more fun out of what he is doing. You go to a movie because someone has told you that it is extra good—you want to increase your pleasure. You learn the rules of a certain game so that you can increase your pleasure in it, or you join a camera club so that you can meet new friends and increase your pleasure in photography.

An I. P. can do this for you, too-increase your pleasure.

Voices From the Otherside

A certain midwestern state has offered teaching by radio to its remote and urban classrooms. This is a voluntary plan that supplements their regular classroom life and activities. To these classes the radio is now an accustomed event but not common place to the extent that it has been over used. It is eagerly waited for and accepted in the right frame of mind. Isn't it with this same eager awaiting that we find ourselves when we know that an I. P. is on its way. Doesn't our portfolio act as a teaching aid, an aid that has a special personal appeal because it is made up of comments and help from other people just like you and me?

Education through radio is designed to vitalize the work and to stimulate the students to a further interest in their subject. We might say the same about our activities since the portfolio stimulates the worker to further study and interests the worker in the other man's techniques.

Radio has been building up heroes and ideals in the minds of the children who listen to it in their homes. Through these programs the "characters" have become almost real to the children and definitely influence their play, language and habits. The portfolio could have just as powerful an influence on our lives if one would only study these prints thoroughly. Our I. P. also makes real "characters" out of the new friends that we meet through this activity. It is a well known fact that the same basic result may be obtained in different localities, yet the procedure in gaining the result may be quite different. It is this difference

in approach to photography that broadens your mind and you never can tell, you might even learn how to do it better!

The teacher must "set the stage" for her pupils if the radio message is to be of maximum value. So it is with the portfolio, the contacts with these people, the small bits of social understanding that we gain, and the help from the eyes of another culture, all are setting the stage for a better world. In this new world maybe we can take better pictures.

John Hogan FPSA, FRPS, Speaks

While looking over some of the requests in the note books of the I. P., we find one very common question—what is a Pictorial Photograph? The subject is too large to cover adequately, but we can hit the high spots and point out several essential things every pictorial photograph must have.

Any picture of any subject can be pictorial if it is handled in a pictorial manner. Pictures of people, human interest studies, news, pets, nature studies, pictures of places, land and seascapes, patterns, textures, and even scientific, medical or intangibles of all kinds can be handled as pictorials and hung in salons.

What, then, is a "Pictorial Photograph"?

- 1. There must be a center of interest, properly accented by containing the lightest and darkest tones in the entire print.
- All elements of the picture, not a part of this center of interest, must be eliminated or properly subordinated so they do not compete too strongly for attention.
- There must be a mood and atmosphere in keeping with the feeling you wish to convey.
- 4. There must be a pleasing arrangement of lines and masses, with the usual rules of good composition more or less being adhered to. There must be an avoidance of confusion, with a predominant attempt to simplicity.

The print must be a top example of the process used to make it, whether contact, straight projection, or any of the control processes. It must be as pleasing as the materials, chemicals and paper permit—in other words, tops as far as technique is concerned. You can't expect the first print you make to be tops—you must be willing to fill a few wastebaskets in arriving at the best way to make your particular picture.

Only when you make a thorough effort to do so will your work improve. You learn by doing, and you will learn a lot more by working hard for a year on a single picture than you will by making a thousand snapshots and routine enlargements.

If you really want to get to be a good pictorialist, John Hogan can't promise you anything more than Churchill promised the English at the start of the war—"Blood, Sweat and Tears". There will be many times when you will be tempted to say, "The heck with it," and start playing chess or bridge for amusement. But sooner or later every one who tries will turn out a good pictorial print if he is willing to pay the cost in time and effort.

If you would like to be a pictorialist or just increase your pleasure in photography—why not write for further information from Col. Charles J. Perry, Director, International Portfolios, 7431 Ryan Road, El Paso, Texas.

HIGHLIGHTS PROM

Portrait Portfolios

MAURICE H. LOUIS, APSA

While Paul Wolfe, accompanied by A. Aubrey Bodine of Baltimore, is junketing around Mexico during the month of February, I have been called on to write this column. It will be interesting to see how many portraits Paul brings back.

Miss Frieda Brenner, M.Photog., Wauwatosa, Wis., and George B. Wright, managing editor of "American Photography," have consented to act as emergency commentators of Portrait Portfolios.

On February 28, I attended a PSA Convention Committee meeting in New York. Plans are progressing well for making this first August meeting an interesting and successful one. Further details will soon be announced but I can say a highlight of the program will be a boat trip around New York Harbor and up the Hudson River. A truly commodious vessel has been chartered and while some members may miss the rustic side-wheeler and oysters of Baltimore, it is hoped that a repetition of the Chesapeake Bay haze will be conspicuous by its absence.

The new advanced portfolio, #15, began its first circuit in February. This experimental group aroused so much interest that another similar project, #16, is now being formed. The first group was limited to advanced amateurs. However, many professionals set off such a howl on not being admitted that #16 will include them as well as advanced amateurs.

Thomas Limborg, of Minneapolis, will act as commentator of #16. Born in Norway, he studied art for many years. Winner of the PSA Color Division Clerk Maxwell Award, Mr. Limborg has been a professional for twenty years. He is nationally known for his work in color, as well as his character studies.

By the time this appears in print, I will have returned from a month's combination business and pleasure trip to Florida. Through the kind efforts of Portrait Portfolio members, I will speak to the Bethesda CC (Rosita Gostin); Greenville, S. C. CC (Skeets Biber); and Tallahassee, Fla., CC (Coleman Dixon). It is through such efforts as these that PSA plays such an indispensible part. Local and regional barriers are broken down, thereby offering us a better understanding of the problems confronted by others.

Very few prints were entered in the portrait classes of the first Print of the Month contest for January. It seems to have caught many members by surprise but by now they should know that portraits can be entered at any time. Besides having your print personally analyzed (if the entries are not too voluminous) you may help

your portfolio win an annual award. So why not send in a portrait at once?

Susan Sherman, Brooklyn, N. Y., a consistant point winner for Pictorial Photographers of America, judged the January portraits. February prints will be judged under the auspices of the Albany, N. Y., CC, March at St. Petersburg, Fla., CC, and April at Temple CC of Brooklyn, N. Y.

The roster of the new folio #15 is as follows:

Miss Gerda Peterich, APSA, Rochester, N. Y., Commentator
Susan Sherman, Brooklyn, N. Y., Secy.
Edith Worth, Nutley, N. J.
Frederic Calvert, Chester, Pa.
R. E. Collins, Connersville, Ind.
Harry Perry, Jackson, Mich.
F. L. Purrington, Wheaton, Ill.
Art H. Oehl, Winnetka, Ill.
C. R. Freeborn, Lincoln, Nebr.
Chester R. Frye, Lincoln, Nebr.
Joseph D. Roberts, Seattle, Wash.
Roy Wolfe, Portland, Ore.
Ben Knutson, Alamosa, Colo.
G. Carey Carpenter, Baton Rouge, La.
Dr. A. W. Biber, Spartanburg, S. C.
Frank A. Jones, Bristol, Tenn.

MISS EVELYN M. ROBBINS, Associate Editor

Chirps From the Robbins

Are you putting the best prints you can possibly make into your portfolios? Are you reading and practicing the comments made by your fellow members—and most important of all, those of your Commentator? Are you then doing the prints over using all of these good suggestions and resubmitting them in your portfolio to again be commented upon? If you aren't, you are missing all of the benefits that you should derive from your portfolio membershin!

Just observe for a time the progress made by those members who work hard, particularly with their fellow members and Commentator. Then, observe the lack of progress that is made by those members who just sit back, lazily, and put in just any old print to fill in.

I've personally watched, with particular interest, several hard working portfolio members. When they joined the portfolio they were making snapshots-and even those snapshots could only, in all fairness, be classed as "poor". Now, those same members after working hard for a period of time, following the advice of their fellow portfolio members and of their Commentator (several even write to them when they have a particular problem), are the biggest percentage regularly receiving an "in" in the international salons—even the smaller percentage are almost ready to "get their feet wet" in the exhibitions. Not a single one has failed to improve by leaps and bounds!

It isn't a bit too early to start planning, right now, on attending the 1952 Convention in New York City.

Remember the swell "get togethers" we had in the Portfolio Room in Detrolt? That spirit can be, and will be, present in New York.

Wasn't it wonderful to walk into a room and know that there you would find a lot of good guys and gals that you already know by correspondence—and best of all, your Commentator who has worked so hard to help YOU improve! The warm friendly air of everyone made you feel at home immediately.

All this, to say nothing of the privilege of browsing through some very fine portfolios. How about it, will YOU be there?

Reward for Promptness

ELDRIDGE R. CHRISTHILF, HON. PSA, APSA

In the last issue of *The Digest* we announced the fact that Circle #30 was the first Circle to have the pleasure of studying one of the two volumes that John Hogan had prepared showing the control methods used in going from original contact print to finished salon print. This release had no sooner gone into the mails when we came up with another winning Circle—Pictorial Portfolio #60 under the guidance of Evelyn Letts of San Francisco.

It was not too long ago that we asked Evelyn and the group in Circle #60 to take a bow for they had proven that a portfolio, even though it went from coast to coast, could make three circuits in a year. It is not at all surprising, therefore, that Circle #60 has just completed its present circuit well ahead of schedule and will soon be enjoying Volume #2 of the Hogan Portfolios.

And, while we are passing out orchids, we must not overlook the Commentator-Dr. Carrol Turner, APSA, of Memphis, Tennessee. He does a very thorough job on the portfolio, and, as a rule, manages to get it back within a week or ten days at the most. The present circuit was completed the last of January. This is being written on February 10th, and, in the meantime, the portfolio has gone to Dr. Turner, has been handled by him; has come back to Evanston-and now, believe it or not, is on its way to Evelyn Letts to begin a new circuit! This only proves that it CAN be done-but it takes the complete cooperation of each and every member of the Circle as well as the Commentator.

So, the next time you feel that it is impossible for your portfolio to follow the schedule that has been set up, don't lay the blame on Railway Express, but just take a look at what Circles #30 and #60 have done within a short period, and what other Circles are going to do. It all depends on you, and you and YOU!

Those Seals Again

We are still running into opposition in some parts of the country on the part of Railway Express Agency employees in affixing the seals as requested. A recent case of this was in Brooklyn, New York, where Gerald Greenidge met a refusal that caused him to write as follows:

I wish to say that I've 'run into difficulty' as far as those Railway Express Griplock Seals are concerned. The agent at the 38 Hanson Place Railway Express Station in Brooklyn says that his regulations only allow him to place the seals on luggage. The question arises as to what should I do about the portfolio I expect in January.

We replied, in part:

Explain to the agent that the action is being taken at the suggestion of Railway Express Agency to prevent tampering with the portfolios and to cut down on the claims that they have had to pay for the theft of prints from the portfolios. The agents are supposed to place such seals on shipments upon request—and at NO extra cost or increase in rates.

We have now received the following reply from Gerald:

With your letter as a basis, I took the matter up with the Agent-In-Charge of the 38 Hanson Street Brooklyn Station. He restated what you had said concerning the sealer and said if I had any further difficulties with the agent on duty, to simply ask for the Assistant Agent-In-Charge. Since that time I have sent out two Portfolios—with sealers.

This is being quoted so that any of you who run into difficulties may try the same approach. It has stopped all thefts from portfolios since we began the practice of shipping under seal.

Comments By a Commentator

ROBERT L. McFerran, APSA, Commentator, Portfolio #21

A portfolio circle consists basically of two elements: The members of the portfolio, and the Commentator.

Each element owes something to the other. The Commentator accepts an obligation, when he becomes a Commentator to devote enough time to his job to make his comments and suggestions and criticisms workable and valuable to the members of the circle. The members owe to their Commentator a willingness to accept his suggestions and to follow them. If the members do not accept and follow the recommendations of the Commentator, then there is no particular point in having a Commentator at all.

Being a Commentator is not an easy job. I would like to be absolutely honest and straightforward. I would like to be able to say, without hesitation, when circumstances warrant: "I see no possibility of this print being classed 'pictorial'." It is understood, of course, that a complete explanation would be included—to explain why the print is hopeless from the pictorial standpoint.

I do not expect beginning pictorialists to have the skin of a rhinoceros, but I like to feel that these would-be pictorialists are adult enough to be able to take frank criticism without curling up their toes. I do not believe that it is good practice to encourage a person to work on a negative that has no pictorial possibilities.

On the other hand, when I see that a picture definitely does have pictorial possibilities, and I suggest those possibilities in detail, I would like to feel sure that my suggestions will be followed, and followed to the letter. It is probably true that most of us who act as Commentators get discouraged, now and then, because after all the work we do to make suggestions, we have no evidence that those suggestions have been followed.

There is still another relationship within a portfolio that seems worthy of comment: The relationship between the members themselves. I have noticed that the portfolio members who give nothing but praise to the prints of other makers generally fare all too well in the comments made by their fellow-members, whereas the "tough" members, who tear into bad prints, generally get more adverse criticisms.

A portfolio shouldn't turn into a mutual admiration society. The member who does an honest and straightforward job of criticizing the prints of his fellow-members, even if many of his criticisms are adverse, is a very great asset to a portfolio. He should not be penalized by having his prints torn apart unjustly simply because some other member was irritated by his adverse comments.

To make a comment as to a weakness observed in the work of beginners, would have to do with the tonal range of the negatives produced by most beginners. It should be emphasized that a good picture starts with a good negative. While the use of soft papers and hard papers can to a degree compensate for the faults of a negative, we must accept the fact that a negative which produces a full range of tones on a normal or #2 paper is the ideal negative, and the one we should seek to make.

As old as photography is the rule, "Expose for the shadows, and develop for the highlights." That was a good rule when grandpa exposed his wet plates; it is a good rule today, no matter how fine and modern your equipment may be.

If the exposure is not adequate to develop details in the shadow, you will have black and empty shadows. This overexposure must be compensated by under development. Thus you provide good shadow detail and climinate blocked highlights.

There is no great trick to the art of exposing for the shadows, and developing for the highlights. Any reasonably complete book on the fundamentals of photography will explain exactly what is meant by this axiom, and how to get detail in your shadows by proper exposure, and control highlights, through development.

Whether you are taking record shots for

AN INVITATION

This is an invitation to every PSA member to participate in the PSA American Portfolios.

Enrollments are now being received in the following specialized groups:

PSA Pictorial Portfolios
PSA Portrait Portfolios
PSA Miniature Portfolios
PSA Control Process Portfolios
PSA Star Exhibitor Portfolios
(For PSA Award of Merit Winners)
PSA Nature Portfolios
PSA Photo-Journalism Portfolios

For information concerning any of the foregoing activities and for enrollment blanks, write to the Director of the PSA American Portfolios, Eldridge R. Christhilf, Hon. PSA, APSA, Suite 406, 800 Davis Street, Evanston, Illinois. the family album, or pictures which you hope will hang in an international salon, a good negative is a prerequisite. The only difference between a fine album shot and an outstanding salon print in many instances is your final treatment of the subject, in composing and print technique.

Finally—if you will remake a print and resubmit through your portfolio following your Commentator's recommendations, the group can benefit through comparison and your Commentator will be assured of your interest in attempting to improve your work.

GEORGE GREEN, Associate Editor

What Is Technique?

Technique, according to Webster, is "the application of science to the arts." The definition sure covers a lot of ground and is brought up to a sharp turn in the road by the sign which asks: "What is Art?"

Does one begin where the other leaves off? Are both synonomous? In order to produce a work of art one requires the science of knowing how to do it. So, I can see that a part of good technique is knowledge knowing what you want to do and how to do it. And, because we are human beings who think, it is readily understandable that such technique will vary with the individual's reactions and approach to the problem.

All of the above being true and the premise established that although two people may think alike their approach to achieving the same ultimate end will be different, we find that in photography, like oils, two routes will lead to the same road. In photography, the camerist has the opportunity of perpetuating upon film and paper the art which abounds around him; an opportunity to indulge in all the various approaches his mind can conceive in either the use of filters, type of film, exposure, darkroom processes, etc.

Then, if the aforementioned is true and technique, although variable, can be used to achieve the same end result, what is good technique? What sort of a camera and what make enlarger and how many hours of sweating it out in the darkroom is required before a salon print can be produced which will place in one of the awards? Is technique based upon the equipment used or is it founded upon strong working knowledge of the subject matter and the tools such as camera and film?

We have seen excellent work produced from a box camera which sold for less than \$2. By the same token we have seen acceptable and award-winning prints made from a home-made enlarger employing a tin can as lamphouse. And, as you know, the converse is true, we have all seen the miserable results of the Sunday Snappers even though their equipment cost hundreds of dollars. Then, the matter is self-explanatory . . . technique is essential in photography! Tools are important in relation to the user's knowledge of how to obtain the most from them.

So, technique is knowledge and knowledge is learning. How does one go about learning what is good technique in photography? How does one learn to see what the eyes look upon? How does one learn how to sift the subject matter in relationship to the finished print prior to making the exposure? How does one learn to challenge what he sees so that the reflexes automatically point the angle and the correct exposure—translating it from what he sees to what he will obtain?

Well, you PSAers are lucky. Especially if you are a member of the Pictorial Division. We can't teach you what to see but we can point out how to see. We can't compose your picture for you but we can point the way. We can help you as much as you are willing to be helped. It is absolutely free. All you have to do is follow these simple rules:

Make one contact print and one enlargement of the negative you would like to work over. On the back of the enlargement print your name, address, why you made the print (club competition, salon, etc.), all the pertinent exposure and developing data. Enclose it with a prepaid envelope to cover first class return mail and send same to J Elwood Armstrong, APSA, Director, Personalized Print Analysis. He will analyze it for you.

Award of Merit

GLENN E. DAHLBY, Director

Are you one of those photographers who uses his camera for doing "Nature Studies"? Would you rather spend hours "sweating out" the tone and texture of a butterflies wings projected upon your printing paper than a few minutes to turn out a profile of your best girl or boy friend? Have you been feeling discriminated against because the Pictorial Division of the PSA has not paid recognition to your field of photographic endeavor? If you are and if you have, I've news for you!

You can indulge in your hobby to your heart's content. You can lavish all the love and care possible to make an acceptable salon print . . . and . . . you may enter it in any recognized pictorial show. If it brings home an award you may count same towards your Award of Merit rating. Now, go out and shoot those toad's toenails and rattlesnake's rattles to your pictorial delight. It should make for more interesting work because you'll be able to win PSA recognition.

Of course, there's always a little gimmick hidden in the fine print . . . and I would like to call your attention to it. The "Nature" print must be entered and accepted in a recognized pictorial show. "Nature" exhibitions do not fall within that classification. Then, one of the requirements for the Award of Merit is that you must be a member in the Pictorial Division

of PSA. It is advisable to include the date of your membership when filing your application for the Award of Merit.

Actually, it doesn't require additional work in order that you may become a Star Exhibitor. All you need to do is to send to the Director a statement listing the titles of the prints on which the application is based, the name of at least one salon where cach was hung, and the total number of acceptances. Requirements for the five degrees of the award are:

One-Star: 6 different prints—30 total acceptances
Two-Star: 16 different prints—80 total acceptances
Three-Star: 32 different prints—160 total acceptances
Four-Star: 64 different prints—320 total acceptances
Five-Star: 128 different prints—640 total acceptances

New Star Exhibitors and changes in ratings since last month are as follows:

New 1-Star Exhibitor
Chicago, Illinois
New 2-Star Exhibitor
Fred C. Kahoun Philadelphia, Pa.
Lionel J. Tedridge, ARPS Windsor, Ontario, Can.
Advanced From 1- to 2-Star
Fresno, California
Advanced From 2- to 3-Star
Mrs. Caryl R. Firth
Roy E. Lindahl Drayton Plains, Mich.

LYNNE PASCHALL, Associate Editor

"Two million Americans have never seen an elephant," says a headline, and the reason is that they have not reached an age when they are interested in things outside the nursery.

I remember distinctly the time when I saw my first elephant. He had been oversold to me. Adults and older children had raved about the giant quadruped until I had formed in my mind a very erroneous picture. I fully expected to see a mammoth creature that towered above the house tops, and when my father lifted me up on the window sill of an up-stairs office so that I could look down into the street and get an unobstructed view of the fabulous pachyderms, I was visibly disappointed. Pooh! They were not much taller than the horses and didn't even reach up to the tops of the band wagons.

Early impressions persist, and do you know, I am still not greatly impressed by the huge unwieldy beasts.

It all leads me to wonder if, in my enthusiasm, I have been over-selling any of the Camera Club Activities. Has any club been disappointed with one of these programs? Has anyone suggestions to offer for improvement? If so, write the director of the particular activity that has fallen short of expectations and give him

a piece of your mind. That's the way we do with pictures, and that is the way we make progress.

Of course, if you liked a program, or the distribution service, the director would be pleased to hear that too.

Camera Club Print Circuits

Circuit 52-A is on its way now with the following clubs participating.

Equitable Life Camera Club... New York, N. Y. Carteret Camera Club..... Carteret, N. J. Glens Falls, N. Y. Piscatagua Camera Club.... Portsmouth, N. H. Lockport Camera Club..... Lockport, N. Y. Community Center Photo. Club... Madison, Wis. Fine Arts Camera Club..... Evansville, Ind. Elmira Camera Club.... Elmira, N. Y.

The commentator for this group is William F. Small, APSA.

There is always a new circuit in the making, and it is never too late to get in on one, but be sure to get your club's three prints in your own hands before you make the reservation.

It is not always possible to have the show arrive for a particular date, so when writing be sure to give a schedule of your meeting nights so that a compromise can be worked out if there is a conflict.

WILLIAM R. HUTCHINSON, Director

Portfolian Clubs

The Lincoln Portfolian Club, of Lincoln, Nebraska, held its second Annual Ladies Night honoring the members' wives, on the evening of December 21st, 1951. Special photographic decorations and center pieces had been prepared by Mrs. Claire Poulson and Mrs. Sten Anderson, utilizing red, yellow, and green painted flash bulbs, and miniature Christmas trees constructed out of film spools and green paper backing cut to represent fir branches. At the conclusion of the banquet, Miss Elizabeth Grone projected nearly a hundred color slides of notable places in Europe, taken while on tour there during the summer of 1951. Twenty people were in attendance, including two guests.

STEN T. ANDERSON, Director

The Portfolio of Portfolios

Mrs. Frances S. Robson, APSA, a pioneer worker in the International Portfolios, conceived the idea of arranging the American and foreign prints of each circuit of an International Portfolio on a large surface and photographing them as two units. She called the activity the "Portfolio of Portfolios", and at her death, the work was continued as a memorial to a dearly loved member of the Pictorial Division.

This activity of the Pictorial Division has now been placed in the hands of "Jim" Johnson of Santa Barbara, California, who is an active member of both American and International Portfolios.

Col. Charles Perry, Director of International Portfolios is working in close harmony with Jim in getting circuits routed to him so that he may make additions to the present collection.

The Portfolio of Pertfolios is available to all camera clubs merely for the asking,

and payment of express charges. For further information write to James T. Johnson, Director, Portfolio of Portfolios, 725 West Sola, Santa Barbara, California.

Recorded Lectures

This has been a very successful activity. William Hutchinson says that the Newburgh Camera Club of which he is a member, has been using some of the Recorded Lectures, and that the members like them very much.

Bill says, "In fact, I am booking all of them for future meetings. I think that they fill a great need for most camera clubs."

PHILIP B. MAPLES, Director

VIEWS AND REVIEWS

BY THE EDITOR

The Real Reasons

The argument still goes on as to whether or not photography is art. So what, I say! What difference does it make?

Why do YOU take pictures? What is your deep down, basic reason?

It isn't to win prizes at your club competitions-or to show your pictures to your friends. It isn't to see how many prints you can get into the salons-or to decorate your walls at home.

For everyone who takes pictures, seriously, does so for just one real reasonthe joy that they receive from creating something of which they can be proud.

Does it matter whether your creative efforts are art or not? Does it matter if fifty or a hundred years from now your efforts will be displayed in a muscum of art-or stored in a dusty attic by your grandchildren as memos of what you did way back in 1952?

No-the important thing is your enjoyment of photography. Oh yes, it is nice, we all admit, to have our prints ooh'd and aah'd over by our fellows in the clubs. It is nice to be able to say we won the top award in PSA's Print of the Month contest-or that we hold the rank of Four Star Exhibitor.

We take pictures because they provide something in our life that would not otherwise be there. Our pictures enable us to release the creative desire which we all have.

But photography does more than this. The creative urge is uppermost, but there is another important part to our enjoyment of photography. That is the enjoyment we get from the friends we make through photography.

Did you ever see two photographers meet for the first time? They may never have seen each other before, and may come from opposite ends of the country-yet immediately there is a friendship formed.

Those of you who have attended PSA conventions know how quickly warm friendships are formed by photographers from New York to California. And some

of these friendships even blossom into a closer relationship and lead to marriage.

It is the friends that we have who make our lives full and happy or empty and pointless.

We enjoy friends who work where we do, friends who attend similar social functions. But the deepest, most satisfying friendships are those we share with others whose creative urges are similar to ourswho see beauty in the same places we see it-who understand our love of sunlight and shadow on a brick wall-or of the play of expression on the face of a childor the understanding of life's problems reflected in the attitude of an old man sitting in the sun.

For creative expression, there is nothing like photography—and let those who are dialectic argue whether or not it is art. For me, I will use it to let my creative wings carry me above mundane, everyday things.

And for friendship, there is nothing like the friendships of our photographers, one for the other. That is probably the most precious return I have gotten from my photography.

-STELLA JENKS

Coming Salons Agreeing to Follow PSA Recommendations

Note: M-monochrome prints, C-color prints, T-color transparencies, SS-stereo slides, L-monochrome slides, A-architectural prints, S-scientific or nature prints. Entry fee is \$1.00 in each class unless otherwise specified. Recognition: The mono-

PSA Recorded Lecture Program

The Recorded Lecture Program of the Pictorial Division offers the following programs for your club.

No. 1. An Analysis of Recognized Salon Prints by Ragnar Hedenvall, **APSA**

No. 2. Commentary on Recognized Salon Prints by Morris Gurrie No. 3. Outdoor Photography by D. Ward Pease, FPSA

No. 4. Still Life by Ann Pilger Dewey, APSA, Hon. PSA. No. 5. New Prints for Old by Bar-

bara Green, APSA SPECIAL Photography of the Nude

by P. H. Oelman, FPSA

A deposit of \$25.00 should accompany an order. A service charge is made for each Lecture. The SPECIAL costs \$10.00 and should be ordered directly from Mr. Oelman. For clubs which are members of PSA but are not affiliated with the PD the charge is \$6.50. Clubs which are affiliated with the PD will be charged \$5.00. Clubs or groups not members of PSA will be quoted prices on request to the Director.

For Nos. 1 to 5 order from Philip B. Maples, Director, Recorded Lecture Program, 29 Spring Street, Brockport, New York.

For the SPECIAL please contact: P. H. Oelman. FPSA, 2505 Moorman Avenue, Cincinnati 6, Ohio.

chrome portions of salons listed have initial Pictorial Division approval. Check salon list of appropriate division for recognition of other sections.

Forestry Building, State College, Penna.

Color Slides Projected In Wards

Color slides are very popular among the bed patients and ambulatory alike in the wards these rainy, dark days. The Red Cross has for a long time been the recipient of color slides of subject material ranging from scenes of the Bay Bridge to safaris in darkest Africa. Karl A. Baumgaertel, APSA, of San Francisco, has been responsible for promoting a drive to gather a collection for use in military hospitals in the Pacific Area (Western States and Far Eastern Theatre Hospitals) for recreational purposes. The color slides which cover photographs of the United States and territorial possessions, have long passed the quarter million mark in the number of slides grouped and collected for hospital distribution. Mr. Baumgaertel monthly brings this slide contribution into the office of Miss Ruth Wolff, Recreation Consultant, Pacific Area Red Cross Office in San Francisco; in the last donation there were over 1100 slides. The pictures have been catalogued and are available to all who are interested in "places and things" the world

Recently while projecting the slides of Far Eastern countries to Korean casualties in an amputee ward, a group of the men contributed slides that they themselves had "shot" enroute overseas while in Japan and Korea. The patients enjoyed comparing notes on areas they had at one time visited, pictures of wide appeal and great variety. Color slides are a pleasant recreation of rebuilding happy memories, greeting former friends while convalescing in bed or wheel chair. To shutterbugs, too, it is an incentive to take more pictures ranging from the wide open spaces to snow capped mountains to be retained for many years to come. Those "far-away" places come to life, as well as American cities and farm lands of ward buddies, who, perhaps, many times have regaled you with "it's the very best spot to live." Now he can convince you with color slides. Want to make a visit to a certain destination, let us know and we will bring some of these slides and a projector to your ward. And a big vote of thanks to Mr. Baumgaertel and the members of the PSA for their thoughtfulness in gathering together the slides; we cagerly await the next group of pictures. -From "Oak Leaf", publication of the U. S. Naval Hospital, Oakland, California.

Are You Getting Fun Out of Color???

What about those hundreds of color slides you and I make each year, that are beautiful to look at, yet do not possess competition possibilities?

Most of us are members of camera clubs having monthly competitions where we can enter only one to four slides each month

Patients in U. S. Naval Hospital, Oakland, Calif., enjoying color slides contributed by PSA members. Official U. S. Navy Photograph.

depending upon the size of the club. This means that of the many rolls of color film we expose no more than 48 slides can be shown during one calendar year. What about the others? Do you sadly file them away hoping someone will ask to see them?

Many color enthusiasts are beginning to question whether or not they are getting the maximum pleasure from showing only their competition slides. Some weary of the eternal competitive spirit in clubs, especially when the majority of comments by judges leave them more confused than enlightened.

With such complaints reaching our ears, we in Long Beach, have organized a new kind of "color" organization wherein we are determined upon adhering to two basic principles:—(1) to enjoy color photography to its fullest extent. (2) To share this enjoyment with a reasonable sized group of congenial fellow color photographers.

To accomplish these ends we have done away with any chance for the petty politics which have ruined more than one good club. We have no monthly competitions. Our only competitive efforts being submissions to international exhibitions and to the five PSA Color Division Club Contests each year. We have three types of meetings, alternating between (1) a slide clinic wherein we discuss our slides and attempt to correct obvious faults before the slides reach the judges in competitions, PSA club contests or international exhibitions; (2) during the year each member has the opportunity to show one or more series of non-competitive slides; (3) a guest or two either show an interesting series of slides or give a demonstration or lecture on some interesting phase of photography. Also, whenever we can get material we have special programs of general interest to members; these may be either technical or entertaining.

Most of us belong to other clubs. In our new organization, Color Pictorialists of Long Beach, we believe we have found a way to have only real pleasure in color photography. Another trend toward getting away from the routine camera club activities is the increasing number of "Color Slide Parties" being given in this area. Groups of non-photographers such as churches, civic clubs, social clubs, etc. are requesting slide shows. This not only gives the color photographer an opportunity to share his pictures but invariably increases the public's interest in color photography, even causing some to take up photography.

This home show idea is also becoming more and more popular with Camera Club members. Several have aided the PSA Slides-for-veterans program, by charging an admission from each guest, of ten slides for veterans.—Vella L. Finne

Watch That Foreground

"The most common fault with pictures is too much foreground." This is the bold assertion in a recent camera club bulletin.

What do you think?

Certainly, a lot of foreground, all out of focus is death to any pictorial slide. Certainly, a lot of foreground with a jumbled up mess of objects and lines in it, is "out the window." Certainly, a lot of foreground with heavy dark shaded areas, or bright horizontal masses like sidewalks is "ouch" to any judge.

But what are we going to substitute for these objectional foregrounds. Surely, not more burned out sky areas, or plain blue masses.

Creating a good slide is often a matter of selecting the lesser of two pictorial evils. My guess is that a majority of the pictures with that common fault of too much foreground could not be raised to an exhibition level just by raising the camera angle and reducing the foreground area. Producing exhibition slides is usually not that simple. It is extremely important that we be "foreground" conscious, but the real remedy is not merely to reduce the foreground area; we must search out a viewpoint, a camera angle that places all areas in the picture in proper relationship and support of each other. When you find that fortunate position, the "muchness" of the foreground takes care of itself. G. F. J.

Clean Slides To and Fro

Much has been written about the way the prospective exhibitor should prepare his slides for entry in an exhibition. The slides should be dust free on inside, thumbmarked properly, labeled clearly with name of maker and title, etc.

Now comes some refreshing words from an exhibition that feels it has an obligation to return "clean" slides to the color photographers who make the exhibition possible. The March 1952 Bulletin of the Chicago International Nature Photography Exhibition has the following to say about clean slides:

"Perhaps some of you who are experienced exhibitors have noted that you receive your slide back without the usual little sequence number label on it. The answer is that we do not use these; we paste nothing onto the slide. All entries are handled and sorted by maker's name, not by key numbers. This means that your entries come back to you as clean as you

sent them (especially since all slides are polished)."

It has been particularly disturbing to the writer to have his slides returned with the sequence number label pasted over a portion of the title, or over the numbered thumb mark, or over the exhibitor's name and addess so that special work is required to return the slide to the same clean, legible state it was in when sent to the exhibition. Surely, there is sufficient space on the slide to place a small sequence label somewhere else than right over the top of essential information on the slide. G. F. J.

Slide Contests for Individuals

Plans are already under way for the 1952-53 National Color Slide Competitions for Individuals. This Color Division activity is for individuals and consists of a series of five contests each season with deadlines on the 20th of September, November, January, March and May. The judging is done by camera clubs and the judging points are rotated. There is no entry fee for Color Division members; non-members pay \$1.00 for the series.

The growth of these contests may require a division into an advanced and a beginners group next year. The contest supervisor reports that he is in search of qualified clubs to conduct these contests during the coming season. For full information contact Charles B. McKee, APSA, 5030 Del Rio Drive, Sacramento 18, California.

All Color Print Exhibit

The Natural Color Camera Club of Pittsburgh recently conducted its Third Annual All Color Print Exhibition with prints entered by outstanding workers throughout the country. In addition to the competitive entries, invitational pictures were on display from Maurice C. La Claire, Harry K. Shigeta, and Arthur Swoger. The Exhibition was hung in the Arts and Crafts Center in Pittsburgh, and was open to the public.

21/4" x 21/4" Slide Groups

The 2½" x 2½" slide study groups are increasing in popularity. Two such groups are now under way. Any prospective members should contact Walt Carter, 4153 Adams Avenue, San Dicgo, California.

Getting the Most from Your Vacation

The majority of us have to work ... and hard ... for fifty weeks a year. We have two precious weeks of vacation which we want to make the most of ... to a photographer, of course, that means getting as many fine pictures as possible. What is the best way to do this?

Advance planning is a most important factor. Too many times we decide to go to the Canadian Rockies, the Pacific Northwest, Yosemite National Park or some other very scenic place and expect to come back with a lot of exhibition slides. Instead, most of us will bring back a series of snapshots of the same subjects that everyone else who has been in that area has. This is largely because we do not know just where to go . . . in so many instances the most outstanding pictures are to be found just a bit off the beaten paths,

;..

A View of Mt. Lefroy, Benff National Park, by Vella L. Finne

yet we speed by them on the main road at 50 miles an hour. At other times we pass a scene which would be a prize-winner if we could be there to get it earlier or later in the day when the light was better, but we have to hurry along to find a place to sleep for the night.

For example, suppose we decide to go to the Canadian Rockies. One of the best sources of information is the members of your camera club who have been there. Lots of times they, too, have made a rush trip but probably they can tell you a few things, such as, that the best pictures of Lake Louise are made shortly after sunrise, that Takakkaw Falls in Yoho National Park is an afternoon shot and that to get to Lake O'Hara, one of the most beautiful to be found anywhere in the world, requires a bit of a hike.

What photographer isn't looking for the slightest excuse to show his slides of his trip and to tell you all about it? Take advantage of this and give him the fun of reliving his trip. You probably will get enough information and enjoyment to more than pay for the time invested. The public library is another source of information as is the Canadian Government which will be glad to send you literature. Go over all of this thoroughly as it will pay dividends in the form of more and better pictures.

Another most important point is this . . . the trip will be much more enjoyable if a group of photographers can go together. It is very helpful to have others to talk over photographic problems with as they arise. They will not worry so much about the time that it takes to take a picture . . . it is often difficult to explain satisfactorily to a non-photographer just why it takes so much time to find just the right spot or just the right angle and why you can not just cock the shutter and shoot the picture.

There are regular sight-seeing trips by train and bus but these usually are quite unsatisfactory from the viewpoint of the photographer. The train will stop only at stations and it is most heart-rending to see a beautiful picture whiz by at 75 miles an hour and not be able to stop and photograph it. The bus trips are apt to be a little better as they stop more often for a few minutes at special points of interest. These stops are not as numerous nor always just in the place that the photographer wishes... here again it is very difficult to get anything other than the general run of postcard shots.

Reservations are another problem. In popular resort areas, they must be made well in advance in order to be sure of getting just what you want. If you do not know the area thoroughly, you will probably make them for three days in one place and three in another. Upon arrival you may find that one day at the first place was a great sufficiency, while the second had material for several more days of shooting.

The ideal way, of course, would be to go with an expert photographer who knows the country thoroughly and can point out the best places to get what you want . . . outstanding and different slides . . . but that, unfortunately, is an opportunity which may come to most of us but once in a lifetime.

The picture reproduced herewith is an example of a fine shot which is quite apt to be missed as it is not on the main highway and one has to know just where to find it . . .—VELLA L. FINNE

Coming Color Exhibitions

Reading, June 11-13, deadline May 19. Four alides, \$1. Forms: Norman Weber, 550 N. 11th St., Reading, Pa.

PSA JOURNAL, Vol. 18, May 1952

PSA NATURE DIVISION

HARRY R. REICH, APSA

286 Schenck St., No. Tonawanda, New York

May Nature Print Contest

The second Nature Division Print Contest of 1952 will be judged in Rochester, New York, as a regular program of the nature section of Kodak Camera Club. Mr. Edward H. Bourne will again serve as chairman for this contest and all prints entered should be mailed to him at Kodak CC, Kodak Park, Rochester 4, New York. The deadline for receiving prints is May 15th and the judging will take place at the next regular meeting of the club.

For the benefit of the newer members of the Nature Division we would like to mention that there are three silver medals awarded to the top scoring prints and that honorable mention ribbons are awarded to the next eight best scoring prints.

This contest is open and without fee to all members of the PSA Nature Division. However, non-members may also submit prints for a nominal fee of fifty cents.

A Word to the Wise

For some time the Nature Division has conducted semi-annual Print and Color Slide Contests for its members, the print contests taking place in January and May, and the color slide contests in April and September. These contests in the past have always proven quite popular with certain members of the Nature Division as indicated by the number of prints and slides submitted. Your Chairman has been very much interested in these contests and has followed them quite closely for the past three years.

An analysis of these contests reveals that the same persons have been following and submitting to them for most of that time. Further revelations are that these entrants are more advanced workers who enter them in the spirit of competition, which in itself is fine. While they were intended as competition for all, they were also designed to offer much more, such as constructive criticism of your efforts and a sast of preexhibit trial of prints and slides. juries have always been carefully selected with the idea in mind to provide judges with jury qualifications. In fact most of the judges of these contests for the past three years have had experience on international exhibition juries.

The entry forms for all N.D. contests have a place to indicate whether criticism is requested. If the entry form indicates that criticism is desired, it is furnished. The way the contests are conducted, the jury is requested to make their comments aloud and these comments are taken down and furnished to the entrant. Certainly any nature worker can see the value of this kind of criticism if he intends to submit his work to international exhibitions for acceptance or rejection.

The writer is of the opinion that the

N.D. print and slide contests are one of the best returns for your dollar investment in Nature Division affiliation. It is up to you to get this return by entering these contests. Probably the best proof of the value of the N.D. contests can be illustrated by revealing that for the April Color Slide Contest there were 36 requests for entry forms from non-members of the Division. Of course, this fact is encouraging because it gives us 36 prospective new members for the Division and also means that probably folks are beginning to realize the real worth of these contests.

Are the Sequences Here to Stay?

In the Nature column of the April JOURNAL this writer mentioned the fact that the Louisville International Exhibit of Nature Photography had broken the ice and agreed to accept both monochrome and color slide sequences. We spoke at length about how well this fact was recrived by the exhibitors and how pleased the salon committee was with the response.

The 16th Rochester Exhibition of Photography followed suit and also agreed to accept the sequences limiting the total submissions to a possible 16 prints or slides, that is four prints or four slides could be submitted as a single print or slide. Again

the exhibitors put their stamp of approval on the idea by submitting a number of such sequences. We noted one exhibitor went all out and took full advantage of the opportunity by submitting a full sequence of 16 slides to present a very fine picture story of one of nature's marvelous phenomena. He was well rewarded by having his 16 slides accepted.

We are hoping that more nature exhibits will look favorably on the sequence idea thereby enabling and encouraging the nature worker to record properly the wonderful and intricate skill of old mother

nature.

New York City in August

We hope that all members of the Nature Division are looking forward to the PSA National Convention in New York City August 12 to 16. We hope also that all division members will be able to arrange their vacations to enable them to attend.

The Nature Division is trying to formulate a program of attractions that will make you sorry if you have to miss it. The nature section of the 1952 Photographic Exhibition will be bigger and better than ever and the nature program for the Convention will eclipse all previous efforts, so don't miss it.

Mr. Warren H. Savary, APSA, is the local representative of the Nature Division on the convention committee and Howard E. Foote, APSA, is in charge of the nature section of the exhibition. You can rest assured that these two active nature workers will do a job of which all N.D. members will be proud and happy to be a part.

Make your plans now. New York City in August 1952.

PSA STEREO DIVISION

DON BENNETT, Assoc. Editor .

28 Leonard Street, Stamford, Conn.

May again, and the outdoor stereo world opening wide for our cameras. Hope you didn't miss the blooms of April, but if you did there is still plenty of subject matter in the growing green world outside your windows. Take foot in one hand. stereo camera in the other and fare forth into the wide open spaces for a summer of

According to an exhibit we saw at the New York Carnival we can now sell all but our stereo cameras! Revere was featuring Diaversal prints made from stereo slides, prints up to 8x10. Nice.

Long letter from Frank Rice coming up soon but we have a few items to round up before we get down to business.

The howl we mentioned last month is still whistling around our ears and we have heard from several of the boys who didn't like our remarks about stereo projection.

We'll spare you the controversy but out of it has come several interesting things. We'll wrap all them into one package and hope that it disposes of the matter for all time.

Judging from some communications from non-manufacturers we were all wet (we meaning DB) about the popularity of stereo projection and the ability of people to buy them. However, many people have been disappointed in stereo projection and for a very good reason. They don't read instructions, they don't listen to instructions, they don't follow instructions. It's as much an American way of thinking as that we can lick the world single-handed so why should we prepare, and let Europe fight it's own battles, and a lot of other stuff that was swell in 1890 but ignores jet propulsion, radar and snorkels.

Stereo projection is not as easy as 2x2 projection. It is not twice the trouble. It is at least eight times the trouble. It pays to read the instruction book (and hope the manufacturer has given it as much thought as he gave his advertising) and follow the book, and ask your dealer to settle any problems (if he knows how) and then you do something additional.

You practice.

You set up a screen in a darkened room,

and you set up your projector and you follow the instruction book line by line as you learn to adjust your projector. Then you project your slides. You learn to adjust the projector to make the slides look right on the screen. And you learn which slides are mounted properly and thus don't need adjustment. And you remount the other 95% of your slides until they can be run through with the minimum of adjustment, which means leaving the darned controls alone after you once set them.

And you practice several more nights to make sure you have mastered it.

And before you call the neighbors in, you have tried looking at the screen from every seat in the room until you know from where it looks good and from where it looks lousy. And from where it looks lousy you take the chairs away so people will have to sit only from where it looks good.

And then you recheck all your slides and every pair of spectacles to make sure every pair is right and doesn't leak and is the right type for your projector, because there are two types.

And you try setting the screen at different distances and find the one best distance. And you mark that distance with a piece of adhesive tape on your projector extension cord so you'll always be able to measure that optimum distance and not have to send your wife back home for a tape measure.

And if you have proudly scheduled yourself for a club show, you sneak down the night before and find all the lousy scats and put fly paper on them so people will only sit in the good seats and you also find out where the outlets are, and the light switches and then you have a rehearsal and you bop the guy who didn't bring his slides for the rehearsal and refuse to show them the night of the club show period.

Catch on? The best projector and the lousiest projector are both stinko if misused. We said it before and we'll shout it as long as people keep taking up photography: NEVER practice on anything you can't throw away. Always try out everything new and master it before you use it seriously.

Plastic Problems

Now to get down to cases. We made some remarks about plastic slides. We later softened those remarks. Both previous statements still stand. There are some plastic slides that are no good for projection and some that might work and some that will work. Dick Kriebel of Polaroid suggests an interesting test. Take a pair of Polaroid specs, the cheap paper kind, fold them in half at the nose notch and see if they black out when the Polaroid filters lie on top of each other. If they don't, tear the frame in half at the nose and lay them front to back. One way or the other you get extinction. (As these specs are inexpensive you can afford to do this right in the store where you can test various types of stereo mounts.)

Now take the mount that is under consideration and put it between the Polaroids. For this first test it need not have film in

it. If it is a molded plastic mount it will probably become visible since most molded plastics de-polarize the light. (As a standard of comparison, crumple the cellophane from your cigarette pack and slip it in the sandwich.) It is necessary to look at a strong light through the pile of filters and test material. If the material does not de-polarize you will see nothing. If it does you will see a weirdly beautiful array of colors.

If the material depolarizes the mount is unsuitable for projection, because projectors depend on polarized light to keep right and left eye images separated.

Now rears a second ugly trouble. You may be able to see it in this simple test, you may need a projector to detect it.

Take a deep breath. Now say birefringence! Some plastics have it bad. Others have only a little. In some it is so minute or non-existant that it can't be detected. What is it? Well, your colors slip slideways in two directions when you have it. They don't look like your pretty color stereos any more.

Mounting for Projection

If you are mounting for projection you must watch these points. If you are mounting now for the projector you hope to get later, watch these points. If you never plan to project, mount any way you want.

One of our readers challenges us as to what we consider the best method of mounting. Our answer is—none. know several quite well. It all depends on what use we plan to make of our stereo shots. Not all our shots are perfect. Lots of them are of little interest outside the family group. Those we will keep in the cheap cardboard mounts. Some that might be handled a lot but used only in viewers we may put in depolarizing and birefringent plastic. Those we know we will project will probably be put in glass because glass seems to be the only completely satisfactory solution to mounting for projection at this time. However, despite dust and dirt we will not completely seal our glass slides. We will leave ventilating openings so moisture will not be trapped inside during projection. When we use metal mounts (we like the kind that slide together) we'll clip the corners to let the "steam" out.)

And we'll probably use Herb McKay's Stereo Guild aligning jig in mounting them so they will be properly aligned for mounting.

Now we hope we have summed up the projector-mountant angles for some time to come. We have the unfortunate habit of assuming that people know something about some things and don't spell everything out in little letters. Some of these omissions have caused the current controversy in our mailbox. Fortunately the hassle has brought forth items like Dick Kriebel's stunt above that will benefit all of us

Polarized Light Ghosts

Now, one more point on projection. Nobody wrote us about this, we thought it up all by ourselves. Polaroid material is used pretty universally for projecting and viewing stereo. Polaroid is a clever material. It lets light through in only one vibratory plane (see any standard textbook for how). That bare statement is true and untrue. Polaroid can be made in various strengths. It has a measurable density, or, inversely, light transmission. It can be made so that crossed Polaroids have a transmission infinitely small so that it seems totally black (transmission possibly as low as 0.1%) or the grating can be so open that the transmission when crossed might be as high as 80%. Actual ranges are not important to this discussion.

The ideal viewing filter would be one that has 100% forward transmission, 0.00001% backward transmission. That is, all the light we wanted from the aligned Polaroids would come through, none would come through the crossed ones. Follow us this far?

That ideal is not possible in the present state of the art. We must compromise. We must have a crossed transmission low enough that the right eye seeth not what the left eye seeth, but the right eye seeth all that is possible of what the right eye should see. That means there is a definite light loss all the way from lamp to film to screen to eye. We don't know exactly what the transmissions are. We do know that a commercially practical compromise has been achieved which permits a bright screen picture without excessive wattage in the projector. We also know that in many cases this is achieved at the sacrifice of total extinction of the crossed filters.

If you didn't know about this, you'd never notice it. But since some people make an undue point of it, let's drag it out in the open and slay the dragon.

An expert can detect the leakage at a g'ance, and will probably announce that he has discovered a ghost. That's one name for it. If you really want to see it, cover one lens of the projector and the opposite filter of your specs. You'll see a faint image. Uncover and you may still be able to see it. If you do, forget it and enjoy the show. You won't notice it on the next slide probably.

Taking a wild guess, we'd say that if the filters in the projector and the specs both had 25% transmission (and that is equivalent to a 4X filter on your camera) you wouldn't see a ghost. But if you had a 1000-watt lamp in your projector, the light coming out of the projector would be equivalent to that from a regular projector with a 250-watt lamp. The light reaching your eye would again be reduced by 75% and what you would see on the screen would be about the same as if a 60-watt bulb were used in a regular projector. That seems a very heavy price to pay for perfection, especially since your mind can "unsee" the ghosts if you so direct it. Personally, I'll take less perfection and an enjoyable picture.

Chairman's Letter

Now for Frank Rice's monthly letter to Stereo Division members, and you guys who haven't sent your buck in to the Stereo Division aren't entitled to read this. So there.

"Dear Don:

"The other day you discussed how best

to spot stereo slides. You recommended that they be spotted at the lower left corner, just like we always have done with planar slides. You explained why that practice was started,—it being the spot where the thumb would be, to flip the slide over for projecting. You say that has been the "standard method since the days of the magic lantern, so what is wrong with it for stereo slides?"

"Earl Krause of Jackson Park Camera Club, Chicago, and a long time stereo shooter has the following to say:

"Stereo is different from regular slide work, just as TV is different than radio. Many of the same techniques have carried over but then the same techniques have carried over but then the differences in the mediums show up and gradually new systems develop. One carry-over system that fits stereo about as well as soft-focus lenses is the traditional projectionist's thumb

spot.
"'A thumb spot placed on the lower left corner of a stereo slide will probably never be touched by the human thumb. That digit always hits in the center, right on the label. That's true whether the slide is going into a projector or a hand viewer. Since these slides are not square and cannot go into the machine sideways the projectionist doesn't have to identify any corner, only the top. Then he flips the slide into the carrier

upside down.
"'So consider this recommendation: instead of a spot (which means nothing to those who do not project) just label the front and make the top is a dual-purpose practice already more or less standard for hand viewing.'

"That's what Earl recommends. Shall we ask for others' views? Right now there is no standard method for spotting stereo slides. It is high time some official body spoke on the subject. There is no body more official than PSA.

"I should like to throw another spot into the ring. How about putting a neat little beauty spot at front bottom center? There it is easily out of the way. And in projecting, the operator can feel the spot under his thumb as he holds the slide in proper position to drop into the projector.

"And while we are talking about preparing stereo slides, shall we rule that the labels carrying the title, the name of the maker and the number of the slide shall be on the front and right side up as the slide is viewed by hand?

"There have been a few developments since you heard from me last month. (a) A stereo slide instruction set is on the way. We have persuaded the stereo group at the Jackson Park Camera Club (Chicago), Earl Krause, leader, to get busy on one. It is hoped that it will be ready by fall. (b) A stereo library is now a certainty. At the present moment it consists of two booksboth donated by Charles A. Howe, towit: Judge, Stereoscopic Photography (1950), and McKay, Principles of Stereoscopy

"We shall be glad to accept other donations. (Remember you can claim deduction from income tax!) We might even buy some books with SD funds if there is much interest. Let us have your views.

"(c) Unfinished business.—Send in your dollar for the Stereo Division. Room for some more serious workers in the stereo slide circuits. If it isn't yet May 20 when you read this, send George Blaha some slides for the individual competition. See below." FRANK E. RICE, APSA, Chairman

Thanks, Frank. You boys sure caught me with my slides down. After writing the column about dotting the dots, I thought, (I do think occasionally) "Why not put the dot on the corner of the center label, same relative position, but stereowise?" I was too lazy to add the thought to my copy so I laid myself wide open.

I agree with Earl partly, but stereo projection isn't different from regular projection in that the slides are upside down and face the operator (normal projectionist stance is to rear, or side rear of projector.) Personally I'd be more inclined to grasp the slide smack in the center of the bottom edge to feed it into the carrier more easily. So I think I'll be a diehard and insist on dotting my slides on the lower left corner of the center label.

Earl misunderstood one point, not being aged like mc. The slides I was talking about are not square. They are $3\frac{1}{4} \times 4$, or in England, 31/4 x 41/4. The dot position is even more important on 2 x 2 slides since they can be put in vertical or horizontal.

I'll settle for Earl's top edge in bright different color, if he'll string along with my maybe superfluous dot. That way the old timer can feed 'em right, and Johnny Newcome can feed 'em right and the audience is happy and satisfied. (Provided the operator don't fuss with adjustments.) I don't go for your front and center spot, Frank, for the obvious reason that you are introducing another system to recall.

And now for the competition results that Frank mentions. But before we leave you, two things . . . send in that buck, and good

February Stereo Competition

The stereo slide individual competition for the month of February was judged by Mrs. Pearl Schwartz Rice, color lecturer and exhibitor; H. J. Johnson FPSA, past chairman of the Color Division, former vice president of PSA; and Conrad Hodnik, member of the Chicago Stereo Club.

There were 16 entrants who submitted 63 slides.

The judges selected the following win-

Medal Award-Fog at Sunset-Henry C. Crowell, Winnetka

2nd Award-Boats at Willemstadt---Mrs. Charles R. Walgreen, Chicago

3rd Award-Flight-Henry C. Crowell, Winnetka

Award—Amazing Chicago—Julius 4th Wolf, Chicago

Honorable Mentions:

Bait-Lucille V. Kosinske, Chicago Duck on Rock-Henry M. Lubin, Brooklyn, New York

Lovely Hula Hands-Lucille V. Kosinske, Chicago

The closing date for the next contest is May 20. Send your shides to George W. Blaha, 4211 Harvey Avenue, Western Springs, Illinois.

OFFICIAL NOTICES

SUMMARY OF BOARD MEETING MINUTES Meeting No. 1

The annual meeting for the 1951-52 term of the PSA Board of Directors was called to order by

the PSA Board of Directors was called to order by President Harkness at 1:45 p.m. at the Hotel Book-Cadillac, Detroit, Michigan, on October 12. Present were W. E. Chase, N. Harkness, C. Heller, T. T. Holden, V. Hunter, H. J. Johnson, G. Johnson, J. Magee, J. G. Mulder, P. H. Oelman, Constance L. Phelps, H. R. Reich, C. C. Ru'hhoft, W. F. Swann, Doris M. Weber and S. P. Wright. The following Committee Chairmen all were approved by the Board: Frank E. Carlson, Hon. PSA. APSA. By-Laws: John H. Magee, Hon. PSA.

PSA, APSA, By-Laws; John H. Magee, Hon. PSA, APSA, Finance; Arnold V. Stubenrauch, APSA. APSA, Finance; Arnold V. Stubenrauch, APSA, Headquarters; John W. McFarlane, FPSA, Honora; Sewell P. Wright, APSA, Membership; H. J. Johnson, FPSA, Membership Services; Harry Youran, Publications; Miss Vera B. Wilson, Public Relations; John G. Mulder, Hon. PSA, FPSA, Progress Medal; Lyall F. Cross, APSA, Conventions; C. C. Ruchhoft, APSA, Exhibitions; Paul J. Wolf. APSA, Tops. Wolf, APSA, Tops.

There was a long discussion of proposed changes in the PSA JOURNAL leading to the approval of changes in the cover, a page of personal notes and a new time for publication of the Directory.

There was further discussion of additional services for the Canadian members and of the proposed PSA calendar.

A Committee consisting of Oelman, Johnson Magee and Weber was appointed to study the chapter question.

Action 303 renewed the chapters of the Chicago and Chattanooga chapters until the next annual meeting of the Board.

Action 304 decided to postpone participation in e Federation Internationale de l'Art Photographique.

Action 305 granted a year's membership to rthur Hammond, FPSA, and recommended to the Arthur Hammor Honors Committee that he be made an Honorary

Action 306 approved the appointment of Manuel Ampudia as Honorary Representative to Mexico to fill the vacancy created by the death of Gordon C. Abbott.

The meeting adjourned at 5 p.m.

Meeting No. 2

The second meeting of the new term was called to order by the President at 10 a.m., October 14, 1951, at the Book-Cadillac Hotel, Detroit, Michigan, with the following members present: D. B.

gan, with the following members present: I). B. Eisendrath, Jr., N. Harkness, G. F. Johnson, H. J. Johnson, J. Magee, P. H. Oelman, Mrs. C. B. Phelps, Jr., H. R. Reich and Miss Vera B. Wilson. Randolph Wright, Jr., was present by invitation. The Board discussed the proposed Picture of the Month contest and in Action 308 voted to grant to John R. Hogan full authority to handle the Picture of the Month contest with an executive. Picture of the Month contest, with an operating

budget of \$500.00 a year.

As a result of Mr. Chase's conversation with Canadian members, Harkness recommended the establishment of Canada as a fourth region to elect its own representative to the Board of Directors. Action 309 this recommendation was accepted

by the Board.

The question of establishing a Stereo Division was discussed at length, and in Action 310 a Committee consisting of Oelman, Cha se, Eisendrath, Hunter, G. Johnson, H. Johnson, Reich and Swann was appointed to study the matter and report at the

November 10 meeting.

In Action 311 the Board voted to continue the policy of awarding a year's free membership for every five new members brought in by an individual within one year.

The meeting adjourned at 12:20 p.m.

Meeting No. 3

The meeting was called to order at 10:15 a.m. on November 10, 1951 at The Lotos Club in New York City with the following present: Eisendrath, Harkness, Heller, Holden, Magee, Phelps, Wilson and Wolf. Mr. Chambers represented the Publications Committee and Mr. Haimes represented the Color Division. Also present by invitation were John D. Fulton and Herbert S. Leopere.

esented an in Mr. Fulton and Mr. Leopere presented an invitation to PSA to hold the 1953 Convention in Buffalo, and Mr. Holden reported tentative invitations from other cities. Mr. Holden was requested to present formal invitations to the Board as they

Mr. Heller presented a detailed membership summary which was followed by considerable discus-sion of the dues for Life and Sustaining Members. In Action 313 it was voted that dues for Life Membership with one affiliation be raised to \$200.00

as of February 1, 1952.

In Action 314 the Board recommended that a Statement of Policy by the PS&T Editorial Board be carried in the minutes of their meetings and in those of the Publications Committee.

Mr. Heller requested that only two persons, the President and the Treasurer, be considered qualified to sign Society checks, and that they be bonded. He asked that other officers be made co-signers. The Board recommended in Action 315 that the By-Laws Committee draw up an amendment to this effect.

Considerable discussion of the proposed Stereo Division followed, and after an informal poll with an expression of their reasoning by each member, in Action 317 the Board voted that a Stereo Division he established. The vote was 9 in favor, none opposed and two not voting. The full co-operation of the Color Division was pledged by Mr. Haimes, who also wished to go on record as considering the establishment of a supporting Stereo Division as unnecessary.

In Action 318 the Board granted \$250.00 to the Stereo Division to start its operation.

In Action 319 the Board approved the employ-ment by the Publications Committee of Vincent Rocca as Advertising Manager for the PSA

In Action 320 it was unanimously voted to approve a budget of \$1,000.00 for the Public Relations Committee.

In Action 321 it was voted that the Special

Awards Committee be requested to issue a special scroll to Dr. Rowland S, Potter in recognition of his contributions to PSA and to photography, to be presented at the time of his retirement.

The meeting closed at 1:20 p.m.

Meeting No. 4

A mail business meeting, including Proposals 323 through 340, was sent out on February 14. Twenty-four members of the Board responded by the March 3 deadline and all Proposals were

Proposals 323 through 327 approved certain corrections to previous Board minutes and approved those minutes as corrected. Also approved the financial statement of January 31, 1952.

Proposal 328 approved the appointment of Dr.

Herman H. Duerr, FPSA, to the Honors Committee for a full term.

Proposals 328, 329 and 330 accepted the resigna-tion of John W. McFarlane, FPSA, from the Honors Committee and approved the appointment of Dr. Duerr and Dr. Carlton J. Marinus, APSA.

Proposal 331 extended a vote of thanks from the Board to John W. McFarlane for his fine service as Chairman of the Honors Committee.

Proposal 332 approved the appointment of H. Lou Gibson, FPSA, to complete John McFarlane's term on the Honors Committee.

Proposal 333 approved the nomination of Driscoll, Hall, Neblette, Turner and Wahlman to be the Nominating Committee. J. Philip Wahlman, APSA, was named Chairman by the Committee.

Proposal 334 approved the appointment of Lyali F. Cross as District Representative from Michigan, and Proposal 335 approved the appointment of Thomas B. Reed as District Representative from

Proposal 336 approved the award of a Service

Medal to Miss Jane H. Waters.

Proposal 337 approved the suspension of dues privileges for all members temporarily called into the Armed Forces throughout the period of such military service.

Proposal 338 approved the reinstatement of all temporary members of the Armed Forces who have dropped their membership since July 1, 1950, if the member so requests.

Proposal 339 recommended that Divisional publications be sent to members of the Armed Forces by airmail.

Proposal 340 approved a Statement of Policy as submitted by the Publications Committee (the Committee has since offered certain amendments to this Statement to go before a future Board meeting).

Publications Committee Announcement

Money is the subject of conversation at Board meetings more often than you might think, and too often the discussion ends with "It would be wonderful for the Society if we could do it, but where will we get the money?"

Services through the various Divisions or through the inter-division committees, the work of headquarters, the productiveness of every operating unit-everything could be stepped up to the great advantage of every PSA member if the treasury were a bit more prosperous.

A satisfactory financial condition for the whole Society depends considerably upon the cost of publishing PSA JOURNAL which in recent years has required nearly one-third of our entire income.

Because of its vital importance, your Publications Committee has given months of intensive study to this question, and has reached several decisions. We believe it will be possible to give you a better JOURNAL in the future without taking any appreciable amount from the treasury-we hope to do it without any cost at all to the Society through the sale of more advertising and by various publishing changes.

In order to accomplish this objective, your Committee has decided to relate the size of the JOURNAL to its income which will necessitate restricting the number of pages in the next few issues. With less than 60 pages and the need for the news of the activities of many parts of the Society as well as certain other regular features, it obviously will be impossible to print the customary 32-page Special Division Features.

The question of these Features has been discussed in detail, and it has become apparent that any such features of so great length tend to make any one issue a "Special Interest" publication. The alternative is to produce what publishers call a "balanced book" with articles selected by the representatives of each Division in each issue on a planned schedule aimed at making every issue of the JOURNAL of real interest and real value to every reader. We hope that every issue will contain not only at least one article from each Division but one or more that the Divisions' JOURNAL representatives feel is so important to their group that it simply cannot be omitted.

It is expected that certain highly technical articles of special interest to various Divisions will be published for them in "Photographic Science and Technique," the Society's technical publication, which is not a Division Supplement in any sense of the word, but rather a tremendously important contributor to the Society's prestige and influence.

Accordingly, the PD Feature in the April issue will be the last to appear in this form for several months-until the financial status of the Journal warrants enough pages to make the Features possible again. Articles now being prepared and edited by the Division officers for their scheduled Features will be published from month to month on a plan to be worked out by them with the Journal Editor.

We are extremely sorry that we cannot immediately provide the big, thick JOURNAL we would all like and, at the same time, so reduce the Society's expenses as to increase substantially the activities and services that can be made available to you. However, we cannot have our cake and eat it too, so for a time, we shall have to eat a slightly thinner piece. We hope—and believe—you will like it.

And please remember. Your Committee will do anything in its power to give PSA an ever better JOURNAL. Your suggestions and comments will help to make it more nearly as you want it. We not only welcome your suggestion-we urge you to have a part in publishing your PSA JOURNAL.

HARRY YOURAN, Chairman

Maurice H. Louis to Make Tour

A desire to foster greater interest and proficiency in amateur portraiture, as well as furthering the activities of the PSA, has prompted Maurice H. Louis, APSA, of New York, to make a four months, coastto-coast tour lecturing to camera clubs, starting in September. Under the auspices of PSA's National Lecture Program, this undertaking is the most ambitious it has attempted.

Louis is a professional photographer of over fifteen years' experience who now specializes in taking portraits of children in their homes. Having come up from amateur ranks himself, he is acutely aware of the needs of photographers who take pictures for fun, as well as profit.

The fast growing popularity of Louis' program is built on the basic conviction that there is no mystery in making good portraits, or to good photography, in general. A stimulating, working lecture and demonstration is aimed at those who need assistance most . . . the beginner and the less-experienced. Louis sets up his camera and portable, four-light system, the same equipment used by many amateurs, and discusses its proper uses.

What spare time Louis is able to take from his profession, he devotes to helping amateur photographers. He is assistant director and commentator of PSA's Portrait Portfolios, is in charge of judging portrait classes of the Print of the Month contest, and is active on the national Membership Committee.

Maurice Louis is also founder and editor of the quarterly "Portrait Pointers" which makes available the latest information on the subject in digest form and interprets lessons and problems of portraiture in direct, readable fashion.

A Cornerstone Member of PSA, he was honored with an Associateship for "educational and organizational services to photography." He holds other memberships in the Professional Photographers' Society of New York, Photographers' Association of America and Pictorial Photographers of America.

Clubs interested in scheduling Mr. Louis may contact him at 333 West 56th Street, New York 19, N. Y., or they may write Mrs. Barbara Green, FPSA, Chairman, PSA National Lecture Program, 30 Willow Street, Brooklyn 2, N. Y.

BARBARA GREEN, FPSA

COLOR IS A CHALLENGE

These Kodak Accessories can help you make the most of every color shot...indoors or out...day or night.

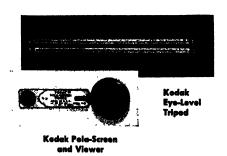

FOR SHARPER PICTURES. Color often calls for slower shutter speeds, which in turn call for a rigid camera support. The Kodak Eye-Level Tripod is easy to carry (only 2 pounds), 3-section legs adjustable from 22½ inches to 5 feet. \$20. Another way to sharper, clearer pictures is the Kodak Metal Cable Release No. 5 . . . eliminates much camera jar. Stainless steel wire covering, protected tip. Fits most shutters. 7-inch size, \$1.05; 12-inch size, \$1.30.

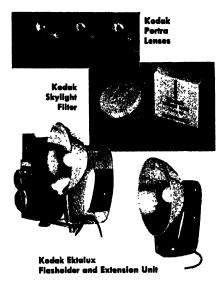

FOR DRAMATIC COLOR. Dramatic cloud backgrounds in the heavens can be emphasized with a Kodak Pola-Screen... without materially changing other tonal values or colors. Also helps to control reflections. Its handy companion, the Kodak Pola-Screen Viewer, shows you how the Pola-Screen on your lens is affecting the scene. Prices: Pola-Screen, Series IV, \$6.75; Series V, \$7.80; Series VI, \$8.80. Pola-Screen Viewer, \$6.75.

FOR SATISFYING CLOSE-UPS. Big, dramatic close-up pictures of flowers, insects, people . . . a whole new world to explore with a camera . . . are yours with a set of Kodak Portra Lenses. Prices: 1+, 2+, 3+, Series V, \$2.91 each. Series VI, \$3.46 each.

FOR SPECIAL SITUATIONS. To avoid excessive bluishness when color film is exposed under open shade or overcast conditions, a Kodak Skylight Filter will help. Another handy filter is the Kodak Daylight Filter for Kodak Type A color films. Suppose you have Type A (indoor) Kodachrome Film in your camera when the outdoors calls. With this filter you can severight out into the sunshine and shoot—witheat changing films. Prices: Series IV, \$1.75; Series VI, \$2.07. Potts Lenses and Kodak Filters are easily attached to your camera with Kodak Combination Lens Attachments.

FOR NIGHT COLOR. For dramatic nighttime pictures of wildlife, of a group around a beach fire . . . or to improve the lighting effects of your daytime pictures you will want to use flash. Here's where the great new Kodak Ektalux Flasholder comes "into the picture." With a special grip for easy hand-holding, the high-energy, battery-condenser-type Ektalux shoots one lamp at a time . . . or up to seven with extension units. Extension units fit tripods, stand on flat surfaces, accept clamps for

attaching to chairs or other objects. Adaptable to most flash cameras and picture-taking situations, the Ektalux is professional equipment at prices beginning at \$29.75. Extension units, \$12.40 each.

FOR GREATER SCOPE. If you own one of the Kodak Tourist f/4.5 Cameras, or a Tourist I f/6.3, add Kodachrome to your color repertoire with the Kodak Tourist Adapter Kit. You can then use Kodachrome (and also Kodacolor and black-and-white) in the 828 size, plus having three other negative sizes, 2½ x 3½, 1½ x 2½, and 2½ x 2½. Complete kit with handy pouch costs only \$13.25. If you own a Kodak Reflex Camera, its handy \$4.59 Adapter Kit lets you use No. 828 Kodachrome, Kodacolor, and black-and-white also.

FOR EXACT GUIDANCE. The Kodak Color Handbook gives the complete story on color picture taking, with detailed information on all Kodak Color Films and how to use them best. \$4. An indispensable pocket companion is the Kodak Master Photoguide. Wallet-size, it has all the essential information you need, including fast-action computers and four contrast-viewing filters. Costs only \$1.75.

FOR LONG-TIME ENJOYMENT. This Kodaslide Table Viewer, 4X lets you show your slides quickly and easily in a lighted room. Projector and screen are one unit. Three-element, Lumenized Kodak Projection Ektanon Lens, 50mm. f/3.5. Focusing knob. AC-DC, 100-120V. \$49.50. Carrying case extra. When there is more time for showing your slides, the Kodaslide Merit Projector will project them big and sharp, with surprising brilliance. Slide insertion is easy with the Merit's top-slot feed. Has Lumenized 5-inch f/3.5 Kodak Projection Ektanon Lens, 150-watt lamp, elevating knob. Costs only \$26.10. Case extra.

At your Kodak dealer's.

Prices include Federal Tax where applicable and are subject to change without notice.

Experts' Choices For Fine Prints

AXEL BAHNSEN
PPSA----FRPS

No. 4 of an informative series...how leading exhibitors choose papers to fit their salon aims

Axel Bahnsen's "Pattern Motif 283" has appeared in the Toronto, Memphis, Smithsonian Institution, Massachusetts Institute of Technology, Dayton Art Institute, and Muncie, Ind., salons. The subject demanded a cool-to-neutral image tone, and print stock that would retain maximum image texture and image detail. Bahnsen chose sleek, glossy Kodabromide Paper F; its pure white stock, glass-smooth surface, and tonal qualities met all requirements.

On paper selection, Axel Bahnsen warns: "Not all experiences can be translated on the same paper or surface. The objective realistic experience demands the brilliance and range of tone values that only a glossy paper can give, whereas the more subjective emotional experiences demand a surface appropriate to the mood to be conveyed."

For photoengraving, "Pattern Motif 283" was reprinted on Kodak Medalist Paper F—the same white stock, but a slightly warmer image tone.

Reliable, high-speed Kodabromide—with its ease of manipulation, five evenly spaced printing contrast grades, and five surfaces—has long been the most popular of all enlarging papers. For high production of uniform prints, it is unsurpassed. But where speed plus flexibility of manipulation plus ease of toning is desired, it now has a robust rival in Kodak Medalist Paper. With Medalist, you can expose fully, develop briefly, and obtain a soft, fully detailed print . . . give a short exposure, and develop fully, for a crisply brilliant print . . . or pick any point in between. Thus, Medalist's four flexible-range printing grades yield a continuous range to fit any soft, hard, hard-to-print, or hard-to-dodge negative. And all four grades have the same speed. Carl Mansfield's "Minnow Catching" (to appear full-page later) is from a print on white, high-lustre Kodak Medalist J.

KNOW YOUR KODAK PAPERS, FOR KNOWLEDGE SPELLS SUCCESS

These are the papers for fine exhibition enlargements, gift prints, home decoration, and specialized applications—in a range of types to fit your every need:

For fast printing, fine warm-black tones, and great flexibility in manipulation—Kodak Medalist Paper.

For rich neutral blacks in a top-speed paper—Kodabromide, five evenly spaced grades and four surfaces.

For rich warm blacks in a moderate-speed paper— Kedah Platino Paper. Two surface choices; three printing grades.

For widest choice of tint and surface in a low-speed paper of utmost tonal quality and adaptability to toning —brown-black *Kedak Opal Paper*. One printing grade.

For Opal quality with twice the speed of Opal—Kedah Ehtilure Paper G.

For Opal quality in a special fine-grained surface suited equally to exhibition and reproduction—Kedak Illustrators' Special.

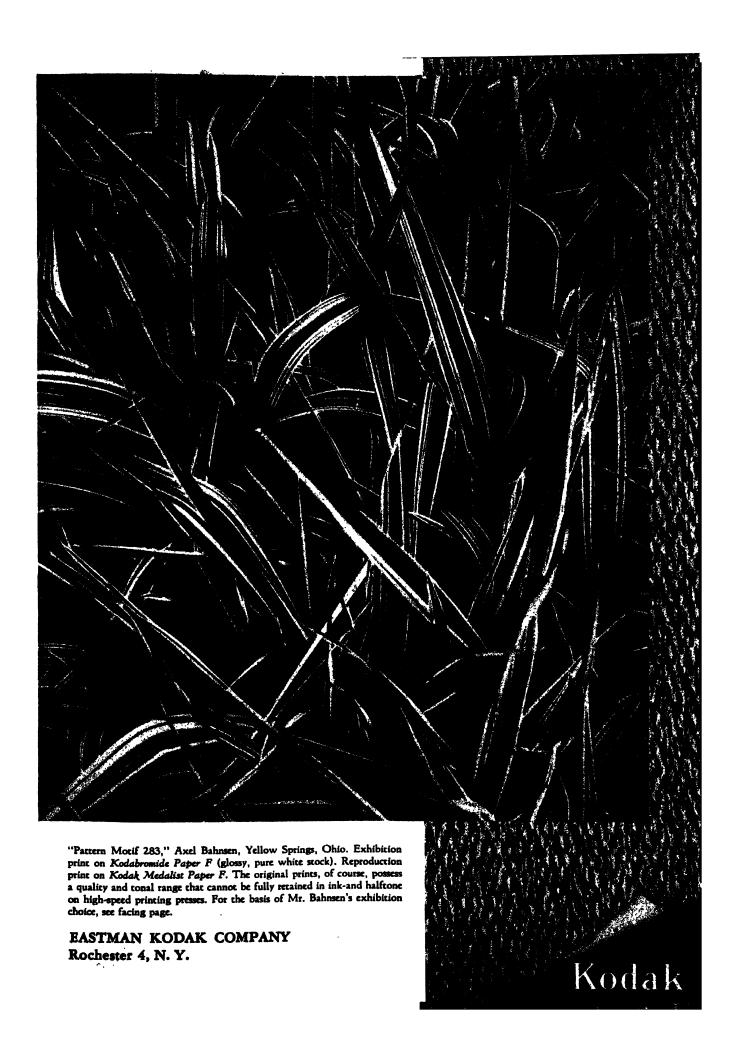

For photomurals, Kodak Mural R.

For transilluminated prints, Kodak Opalure Print Film and Kodak Translite Paper.

For extra-fast printing and processing—Kodak Resiste Rapid N. It's as fast as Kodabromide; and its special base allows washing and drying in ten minutes.

And for contact prints—Kedak Aze, Velex, Resisto N, and others. Each Kodak enlarging paper has a contact-paper counterpart, equivalent in type and quality.

For full details on these fine Kodak papers—tints, surfaces, weights, processing—consult the Data Book on Kodak Papers, and your Kodak dealer.

'ROUND MANHATTAN (From pg. 312)

Palisades on the opposite shore and beautiful city parks on nearby hilly upper Manhattan. Atop one of these hills is The Cloisters, a remarkable collection of medieval art and architecture housed in a structure whose design is in keeping with its contents. It is a branch of the Metropolitan Museum of Art. You can get a very attractive shot here with a standard lens, but you will get a beauty with a telephoto.

By this time you undoubtedly have seen New York's largest bridge looming up ahead, the famous \$60,000,000 George Washington Bridge spanning the Hudson between Manhattan and New Jersey. This is the second longest suspension bridge in the world, being exceeded only by the Golden Gate Bridge at San Francisco. Regardless of how many times you may have seen this structure, you will have a better impression of its size and height after passing underneath it. You can get a number of good distant views as well as several closer shots featuring the details of its structural members—shots of the "designin-steel" type.

At the foot of the huge supporting tower on the Manhattan side is the only lighthouse you will see on the trip. It is painted a bright red; it is so dwarfed by the bridge that otherwise you might miss it.

The remainder of the trip is very scenic, but there are few good picture possibilities. However, there is one more shot you will want to be sure to get—Grant's Tomb and

Riverside Church, which stand quite close together on a prominence just below 125th Street. The former is the final resting place of General Ulysses S. Grant of Civil War fame and his wife. The Church was built and endowed by the Rockefellers, and its artistic 400-foot tower rises far above all surrounding buildings. Here is another place where a telephoto will come in handy, but you can get an excellent shot with a standard lens.

These are the photographic high spots of the trip. Undoubtedly others will appeal to you. The guides will call attention to all these points of interest and many more in ample time for you to shoot as many as you wish.

CAMERA CLUB MANUAL (From pg. 318)

The group would have a chairman, and would meet four times a year, corresponding approximately to the four seasons. At the first meeting, a list of subjects would be prepared, with the suggested angles to make them pictorial. Then members would be assigned (on basis of nearness to the subject, availability of time when lighting is proper, etc.) to obtain the pictures.

At the next meeting each member would bring in all pictures taken and the program would consist of a qualified critic to discuss the pictures, followed by general discussion by the membership, and finally, a vote as to which pictures were acceptable for the project.

These meetings would continue until the desired number of pictures had been accumulated, at which time the project would be completed, or the group could be continued to obtain additional pictures with greater specialization of subjects.

A similar project can be organized for a movie film.

(To Be Continued)

ONE OR TWO TRICKS

Now and then one is asked to do funny things in photography, and now and then one wants to do them for some fell purpose of one's own. One of my own pct hatreds is to be asked to take out one figure from a group; the usual blocking-out plan looks awful, and often the only alternative is to spend hours in working up, or even blowing-in a background with an airbrush. But there is a way that is fairly simple, and which can look very effective sometimes; make a contact positive from the group, taking care that it is of lower density and contrast than the original negative and then on the positive bleach out the wanted figure carefully with a brush and strong ferri or Farmer's. Any but extremely careless mistakes will be masked when the two are combined. If this is done with exactitude, the unwanted parts will appear as a ghost-group, with the wanted figure standing out very boldly. I have done this several times with much appreciation from customers, and it is specially effective in wedding groups to make the principals stand out, while not destroying the effect of a group Many other uses can be thought of also.

Printing in a background can be done on rather the same principle, provided the subject was taken on a dark background to start with; put the figure negative in contact with a sheet of slowish film in a frame, with the required background negative on top of the sandwich. Give a very short exposure, and develop softly. It is then again quite easy to remove all traces of the figure from the positive with reducer, and print from the two together. Once again, any discrepancies will be covered up, and there is no risk of harming the original negative. (A similar method using blocking-out instead of reduction is described in detail in an article by H. H. Goodchild in "B.J.," 1939, May 12th, p. 296.—Eds.) From the British Journal of Photography, March 31, 1950, p. 157.

Ouestions and Answers

Q. Why doesn't the Certificate of Award state whether it is for First place, Second place, or Honorable Mention?

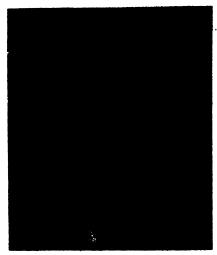

Honorable Mention?

A. Blue ribbon means First, red ribbon means Second, purple ribbon means Honorable Mention. To the uninitiated all have equal value, which is an it should be because there is so little difference between the point winning prints that different judges might get entirely different results.

Q. What is the deadline?

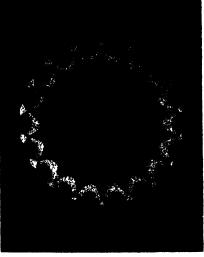

A. There isn't any deadline. Prints will be entered in the month during which they are received.

entered in the month during the pictures in two salons am
I in the Open Pictorial Class?
A. No. Only if you hang MORE than two pic-

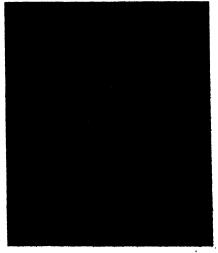

SEVENTY PLUS

tures in MORE than two salons. If you hang one picture in four salons, or four pictures in one salon, or two pictures in two salons you are still in Class 2, Advanced Pictorial.

Q. Where are the Rules published?

A. Page 33 of the January PSA JOURNAL, Page 134 in February.

ESKIMO

Harvey V. Fondiller

Only one of the pictures submitted in Class 9 was worthy of special mention, namely, "Eskimo Mother & Child" by Harvey V. Fondifler, of New York City. Therefore this month's awards will be limited to this one.

I like the picture because it tells me that Eskimo mothers and their litle boys behave about the same way as mothers and boys on my own block, and elsewhere too, I'm sure. What appeals to me most is its directness and simplicity as well as its communicativeness. It tells the observer something he either did not know or had forgotten.

The boy is shy and self-conscious in the face of the stranger photographer and the mother reas-auring, proud of her offspring and generally de-lighted with the whole thing. The candid quality of the shot adds to its interest, the photographer having caught the particular moment that best tells the story of a bashful, somewhat scared little boy hanging on to his mother's skirt out of desperation, and eager to get out of range of the stranger as quickly as possible. However, I would have liked to see some space around the subjects so that more details descriptive of the environment could have been included to complete the story the photographer has tried to tell.

JACOB DESCRIN, APSA.

Remarks

Send as many pictures as you like but BE EASONABLE! One entrant sent twenty, and hile we appreciate the interest and gave him REASONABLE while we appreciate the interest and gave him full service on every print we shudder to think of what might happen if two or three hundred of you were equally enthusiastic all at the same time. Remember what Confucius say, "don't drive a willing horse to drink or break your last straw over a camel's back!"

THE CAPITOL

Mrs. Ester Wy

...

Don't stick labels or other matter on the back of your prints. We can't get them off without damage, the corners of other prints get stuck under them in handling, and we can't do a good job of them in manding, and we can't do a good you or mounting for exhibition with things stuck on the back. Don't write on the back of single weight glossy prints with a ball pointed pen. It emboses right through. Lay off the Scotch Tape. We had to borrow the Mummy Unwrapper from the Museum to get into some of the packages we received

The easiest entry for us to handle is sent between 8 x 10 corrugated boards we can keep together as a unit and return in standard 9 x 12 envelopes. When everything is uniform it saves hours and work and there is less chance for error.

Don't be afraid to send prints now. Nobody has a commanding lead, and there is plenty of time for you to overhaul the leaders. Get some points for your State, your Portfolios, and yourself. JOHN R. HOGAN, Chairman.

PAGODA

R. M. Eisenhauer

NEW MAGAZINE

A quarterly magazine, Aperture, which will be "devoted to serious thinking in photography," is being launched in San Francisco. It will be edited and published by Minor White. At the start, the format will be 6 by 9 inches, each issue will contain five or six fine reproductions and two or three articles and the subscription rate will be \$4.50 a year. The magazine will also be available in a \$25 sustaining subscription, which will include a free print by Ansel Adams.

In addition to Mr. White and Mr. Adams, the group behind the venture consists of Nancy Newhall, Beaumont Newhall, Ernest Louie, Dody Warren, Dorothea Lange, Barbara Morgan and Melton Ferris.

"The articles in Aperture are planned to be of lasting value and to represent the mature thinking of all the branches of photography," according to the announcement. Among the titles and writers scheduled for the first year are "The Caption" and "Survey of New Talent" by Mrs. Newhall; "A Working Esthetic for Miniature Camera" by Mr. White; "The Ethics of the Profession" by Mr. Adams; "Photographing the Commonplace" by Miss Lange; "Light, Motion, Camera" by Mrs. Morgan, and "Problems of a Young Photographer" by Miss Warren. Subscriptions should be sent to Aperture, 135 Jackson Street, San Fran-JACOB DESCHIN

LETTER TO EDITOR

Bogota, Colombia, S. A.

TO THE EDITOR:

I left Canada on November 15, and came here (Bogota, Colombia) by air via Avianca, where I am employed under contract with the Government of Colombia as chief photographic technician of the Canadian Technical Mission. We have a very large photographic operation here, and I find the work and the country very interesting indeed.

Photography is not utilized to the extent with which we are familiar in the United States and Canada. I find that a camera excites considerable curiosity on the streets. There are, of course, very few tourists, which makes a great deal of difference. There are several very good photo supply houses here, with a good stock on hand.

This country is literally a photographer's paradise. Bogota itself is a fascinating place. It is a city of about 600,000, located at the east end of a plateau 8,500 feet up in the Andes. A mountain range lies on the east of the city, with two great mountains, Monserate and Guadalupe, rising to 3 or 4 thousand feet right out of the city streets. The climate is quite pleasant, the temperature in our darkrooms being an unvarying 66° F. the year round.

This is a city of extreme contrasts between the old and the very new. Every morning on the way to work I pass an old church built by the Spaniards about 1530, as well as a great new steel and concrete structure just going up, that is as modern as anything in an American city.

The plateau, called the sabana, is crisscrossed by modern macadam highways, and the city streets are jammed with new automobiles and buses. Bogota might well be called the enchanted city-it is a place that is relatively unknown in the U.S. and Canada, yet the city is a hive of activity, particularly in new construction. Considering the difficulties of transportation, for instance, the progress that is being made here is astonishing. RODGER T. ROSS

Makes prize-winning photography so simple! Perfect composition is easy! One twist of a knob...and you get a razor-sharp image on the ground glass... a print-size preview of what your camera is "seeing"! No more cut-off heads...no more fuzzy, out-of-focus results! A perfect print from every shot!

Ideal for action work or photo-studies...outdoors or indoors... the precision built CIRO-FLEX comes in five models (three with built-in flash). Each has coated lens; steel-welded body; field lens under ground glass for extra brilliance; magnifier and sports-finder in viewing hood. Yet three models are priced below \$100! No wonder that CIRO-FLEX is one of America's most popular cameras... and a best-seller in the famous Graflex prize-winning line!

For Outstanding Prints DON'T OVERLOOK

THESE TWO*

EASTMAN KODAK COMPANY
Rochester 4, N. Y.

***KODAK EKTALURE PAPER G**

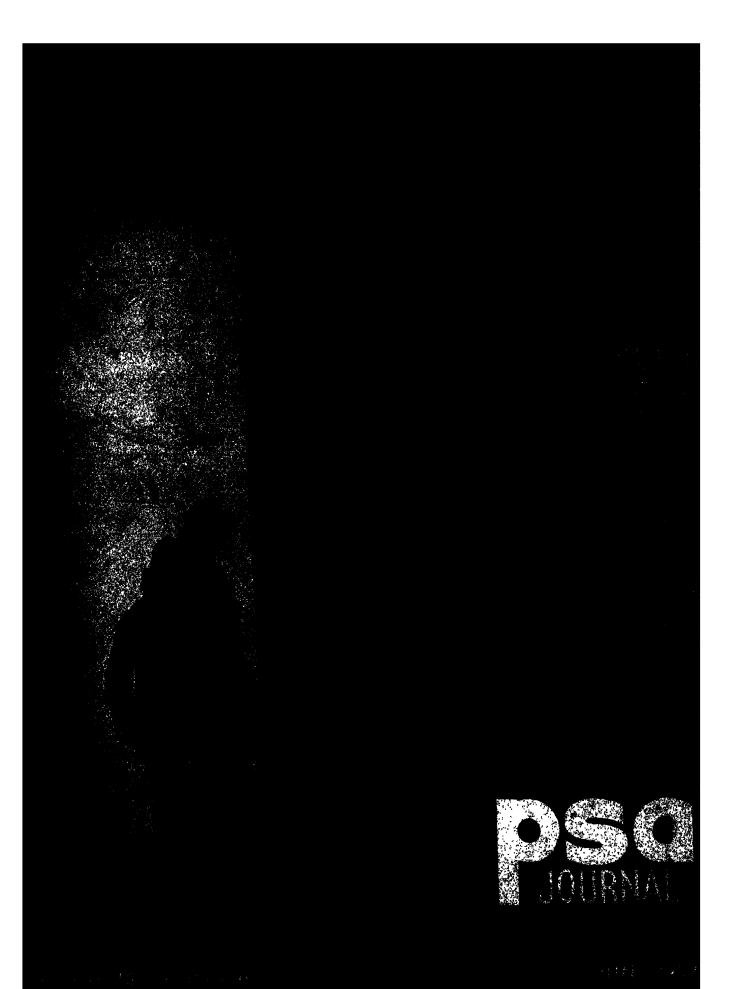

Warmth plus high speed... that's the satisfying combination you get with Kodak Ektalure Paper G. Its speed will cut your printing time by as much as one-half... while giving you prints that will stand out, not only for their warmth, but for their remarkable depth, clarity in highlight and shadow. Ektalure tones superbly, too. Comes in one surface and contrast for normal negatives—G, Cream-white, Fine-grained, Lustre.

*KODAK OPALURE PRINT FILM

Here is a printing medium for your most distinguished efforts... an Opal emulsion on a translucent, ivory-like acetate base. The rich warm blacks of this famous emulsion give depth and luminosity. A perfect medium for miniatures, for de luxe portraits, or outstanding exhibition prints. Provides the ideal base for hand coloring. In one grade only.

Ask to see sample prints at your Kodak dealer's.

Kodak

You're sure of your travel pictures when you carry a Polaroid® Camera. You see results in one minute... and can shoot again if you're not perfectly satisfied. Label your pictures on the spot and mail them off to friends...or keep them for a complete picture story of your trip, ready to show the minute you return.

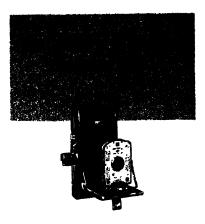

You're a hit at parties and outings when you can show your pictures on the spot — as fast as you take them.

You'll enjoy the simplicity of this fine camera. Easy "drop-in" film loading; easy to set the single dial that controls lens openings and shutter speeds. Easy to remove the brilliant 3½" x 4½" finished print. Extra copies and enlargements can be obtained through your photographic dealer.

Try it! Your photo dealer will gladly arrange a demonstration of the world's most exciting camera.

YOU'LL WONDER WHY YOU EVER WAITED

POLAROID Land CAMERA

Every day brings reports of business jobs done faster and better with 60-second photography. Examples:

MAKES PASS PHOTOS FASTER

Polaroid Identification Camera delivers finished prints. Employees get their passes then and there! No need for temporary passes, no waiting for photos, no red tape. Easy to operate. Folds compactly in carrying case.

ARCHITECTS . . .

use picture-in-aminute photos to
check construction
details, record contractors' performance, and make
progress reports to
clients. Carrying a
Polaroid Camera on
jolaroid reservant
writing many detailed memoranda.

NEWSPAPERS

Polaroid 60-second pictures to make news and advertising photos as fast as big city dailies. (Polaroid film-holding back available for use with Grafic Cameras.) Pictures reproduce well up to three columns.

INSURANCE INVESTIGATORS

carry easy-to-operate Polaroid Cameras. They are sure they have all the evidence they need because they see the pictures on the spot. Photographs are immediately available for reports. Result: Faster handling of claims.

For complete information about the many business applications of Polaroid picture-in-aminute photography, write to Polaroid Corp., Dept. PS-9, Cambridge 39, Massachusetts.

You're all set for Spring!

You couldn't choose a better film for all the varied picture opportunities that spring presents than Ansco Supreme.

Ansco Supreme has the panchromatic sensitivity you need for pleasing black-and-white rendering of spring colors, plenty of emulsion speed, and its extremely fine grain structure lets you make huge en-

largements without distracting grain.

In rolls, film packs and 35mm magazines, you'll find Supreme the "perfect" black-and-white film for 99 out of every 100 springtime pictures you'll take. ANSCO, Binghamton, N. Y. A Division of General Aniline & Film Corporation. "From Research to Reality."

HARRY YOURAN... New York, N. Y.

THE PRESIDENT REPORTS . . .

There is real personal regret in the announcement that this is the last issue of PSA JOURNAL which will be edited by Fred Quellmals, Jr. Fred has worked long and earnestly for the Society earning both his Honorary Membership and the respect of all of us by his efforts. Prior to his service as salaried Editor, he held many of the important executive posts in the Society.

At the meeting of the Board in Philadelphia on April 26, the Board unanimously passed the following resolution:

"Whereas Fred Quellmalz has served PSA well and faithfully over a period of 17 years and as Editor of PSA JOURNAL for 13 years: and

"Whereas he has now tendered his resignation as Editor of The JOURNAL;

"Therefore, be it resolved that the Board of Directors of the Photographic Society of America regretfully accept his resignation and express its appreciation for the valuable work he has done for the Society and commend him for his unselfish devotion."

Every member of the Board and the Publications Committee wishes Fred well and hopes for a happy and prosperous future for him and his family.

The new Editor of PSA JOURNAL will be Don Bennett who joined PSA in 1939 and has served two terms on the Board. A teacher, writer, editor, advertising man, and visual aids specialist and motion picture director for the Dept. of Agriculture, Don brings to PSA JOURNAL a wide diversification of skills and interests. He resigned from his post as Associate Editor of Photo Dealer to become Editor of PSA JOURNAL.

Future editorial affairs will be carried on from his home at 28 Leonard St., Stamford, Conn. All the advertising correspondence for PSA JOURNAL will be handled through the PSA JOURNAL advertising office at 30 East 60th Street, New York 22, where Vincent Rocca has his headquarters.

Don and the members of the Publica-

tions Committee are working on new plans for PSA JOURNAL whose costs for the coming fiscal year has been materially reduced from the figures of recent years. Temporarily, the number of pages in each issue will be held down in accordance with the amount of advertising, but it is expected that the thickness of PSA JOURNAL will soon be increased to at least the old average.

Also for the present, it has been decided to suspend the publication of the Divisional Features as was announced in the May issue. The articles that did appear in them will be scattered through each issue in order to arrive at a higher level of interest for all members in every issue. By this system each Division will have its preferred articles in PSA JOURNAL throughout the year and each issue will have those of most importance as selected by the Division Editorial Representatives.

There will be a number of changes, and your Committee feels confident that you will find them an improvement. Certainly we all hope so!

A recent weekend with PSA'ers in Toronto showed great interest in photography and in PSA in our new Canadian Zone. Everyone concerned feeels that the difficulties which have prevented the fullest flow of PSA services to our members in Canada have been worked out and that we can look forward to great activity in our northern territory. Entirely aside from a most happy weekend among good friends, there is the satisfaction of knowing that their interest plus the eagerness of the Board to prove that there is no border in the sense of any interference with PSA activities assures our ability to contribute successfully to Canadian photography.

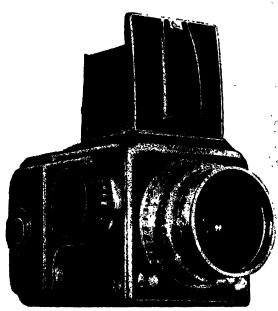

Things like that weekend and the fast increasing interest in the coming Convention with the wonderful programs the Divisional Committees have arranged prove we have a fine and strong Society.

NORTH HARKNESS

PSA JOURNAL, Vol. 18, June 1952

High Fashion

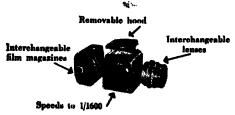

This picture by JAMES ABBE, Jr., is one of many he has made with the HASSELBLAD Camera. Best known for his fashion photography, Mr. Abbe exhibits rare artistic command of subject and technique that make up an effective illustration. In the HASSELBLAD he finds an instrument to match his own exacting talent.

High PERFORMANCE

Prices: The camera, with 80mm Kodak Ektar f/2.8 Lens and 2½ x 2½ roll-film magazine, \$535. Accessory 135mm Kodak Ektar f/3.5 Lens, \$250, and 250mm Zeiss Opton Sonnar f/4 Lens, \$421. Prices include Federal Tax and are subject to change without notice.

This camera by HASSELBLAD sets a new high in photographic performance. Interchangeable roll-film magazines, for example, permit the photographer to switch at any time from one type of film to another... color or black-and-white. Interchangeable lenses, automatic controls, speeds to $^{1}/_{1600}$ second, built-in flash — these and other features will bring a new range, a new sureness, to your picture taking. Precision-crafted in Sweden with an eye to the photographic perfectionist, the $2^{1}/_{4} \times 2^{1}/_{4}$ HASSELBLAD Camera well merits your personal inspection.

THE NEW SWEDISH CAMERA

Write for the descriptive HASSELBIAD booklet to

NEW AIDS FOR BETTER PICTURE-MAKING

By JACOB DESCHIN, APSA

A miscellany of accessories ranging from filters to copying devices heads this month's list of manufacturers' announcements of new products. The copy units are the Macro Object Table and the Copidaptor, the filters are offered in an Ednalite kit for the Contessa 35mm camera. The Macro is an accessory for the Alpa Macrostat lightweight stand for copy work and indoor or outdoor close-up photography, and is offered at \$27.90 by Heitz and Leightburn, 150 West Fifty-fourth Street, New York. The table has a diameter of 4½ths inches, allows small objects to be accurately positioned in relation to the Alpa camera lens, and is equipped with three clamps for attaching cardboard and similar backgrounds.

The Copidaptor, a product of the Copidaptor Company, 1650 Broadway, New York, is a device that permits the user to mount his own camera on his enlarger for copying purposes and is available for twenty-eight makes of enlargers. It will accommodate cameras from 35mm to press size. The Ednalite filter kit contains solid optical glass coated filters, for color and black-and-white. Each kit, in a plastic carrying case, is \$12.50.

Willoughby's, 110 West Thirty-second Street, New York, has introduced the Voigtlander Kontur Sportsfinder Viewfinder, which allows the photographer to view the subject with both eyes open. A device formerly available only for expensive 35mm cameras, the Kontur is designed to fit on any 35mm, 2½x2½ or 2½x3½ camera. It is especially useful in following sports and action subjects. Framing is made easy by four solid white lines that embrace the field seen by the camera. A luminous spot marks the center of the field, parallax compensation is provided for, and the price is \$8.50.

A new line of Elitar telephoto lenses for 8mm cameras is being imported by Interstate Photo Supply Corp., 28 West Twenty-second Street, New York. The lenses come in 1-inch and 1½-inch focal lengths in speeds f/1.5 to f/3.5, in fixed focus and focusing mounts, and range in price from \$9.95 to \$42.50.

Another new movie lens is the fiveelement 1½-inch f/1.5 Japanese-made optic, in chrome mount, with click stops and depth of field scale. Priced at \$42.50 it is imported by the Photographic Importing and Distributing Corp., 20 Broad Street, New York.

Kodak has a new line of snapshot albums, the Kodak Riviera Protecto Albums. Covered with simulated leather, which is embossed in an alligator-type finish with a decorative 24-karat gold band, the new albums come in blue cover with gray paper leaves, brown cover with brown paper leaves, or red cover with gray paper leaves, or red cover with gray paper leaves. The crystal-clear Kodapak folders are bound directly into the gold-plated Mult-O Ring binder which closes with thumb and finger pressure. The album has 12 folders for up to twenty-four 8x10 prints and costs \$8.50.

Something new for the darkroom is the Heat-A-Lite, a combination heater, light and ventilating fan for darkroom ceiling installation, a product of NuTone, Inc., of Cincinnati. Fan and heating element operate from a single switch. Some models are equipped to operate with heating element "off" and fan "on". The unit will heat an area up to 400 cubic feet. Made in four models, the price ranges from \$49.95 to \$64.95.

Spiratone, 49 West Twenty-seventh Street, New York, has just imported from Germany a complete line of extension tubes at prices starting at \$5.95 a set. Tubes are available for the Kine Exakta, Exakta B, Leica, Contax S, II, IIa, and III, Practica, Praktiflex, Primarflex and Mastereflex. Microscope adapter for the Kine Exakta, Practica and Contax S are offered at \$15.95 per set.

Extendolite, a new four-lamp unit that folds to 14 inches and has a rotary dimmer switch for light intensities at three levels, is announced by Mayfair Manufacturing Company, 55 Eckford Street, Brooklyn 22, N. Y. With a carrying case, the unit is \$12.95. A two-light unit, the Extendolite. Jr., is \$7.50.

X-Pando, a new type gadget bag with zippers to permit expansion of the main section or outside pocket, has been placed on the market by Ruko Company, 3 West Eighteenth Street, New York. The bag is made of Texhyde in two sizes, 9x10x3 inches and 14x10½x5 inches.

A leather eveready case is now being included with each deluxe model of the "Ideal" photoelectric exposure meter. Complete with case, the meter is \$9.95. For descriptive folder, write Federal Instrument Corp., 14-02 Broadway, Long Island City 6, N. Y.

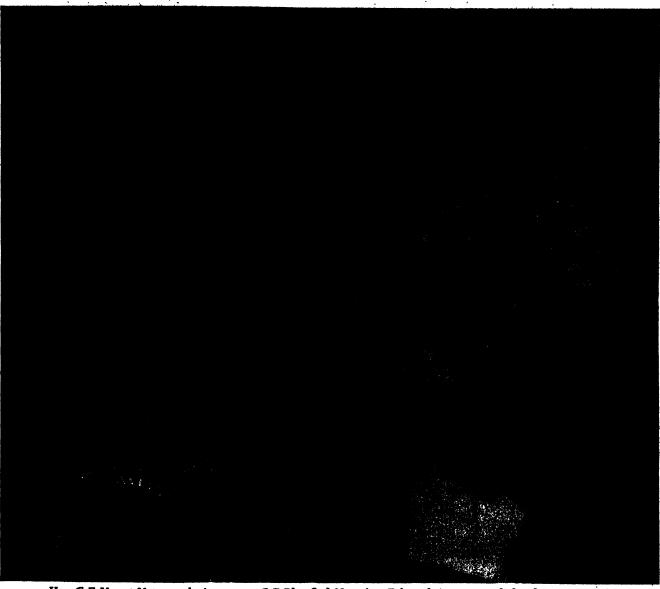

Flash

Ansco has a new Flash Unit, JN206, which incorporates an adapter that permits the use of the unit with all synchro-shutters having either a continental type contact or a standard A.S.A. bayonet contact. The unit has a flash lamp ejector, a standard plug-in socket for multiple flash, a metal mounting bracket with a quick-action locking device, uses C batteries or a battery capacitor cartridge, and costs \$9.95.

If you have a yen for black-out flash, here is your chance to coat your own. Infra-Flash, a lacquer for coating standard Class M medium peak flash lamps to permit the use of the lamp with infrared film, is offered by Scienta Products Company, P. O. Box 1930, Chicago 90, Ill. The lacquer provides a filter coating that absorbs visible and transmits infrared rays in a faint dark red glow, permitting flash photography in total darkness—and nobody the wiser. An introductory pint is \$5. A thinner for the lacquer and clear lacquer for diluting Infra-Flash are also available.

Westinghouse Lamp Division, of Bloomfield, N. J., has placed on the market two new "Flash-Chek" lamps, PT-1 and PT-2,

PSA JOURNAL, Vol. 18, June 1952

Here G-E Mascot Meter sets basic exposure; G-E Photoflash No. 5 (or 5B for color) puts extra light where it's needed.

How to get BETTER pictures in Sunlight

Shoot with G-E Photoflash . . .

to light up foreground shadows . . . control lighting balance

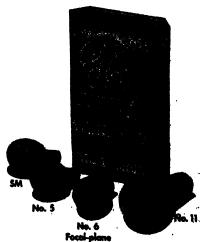

You'll be thrilled with the results of using General Electric Photoflash for sunlight pictures of people! Try it, in color or black and white.

For G-E Photoflash packs the flexibility and the punch of light that makes it easy to balance your lighting, and get detail in shadows under hat brims. And people will have more pleasing expressions if you turn them away from the sun, and shoot with flash.

You'll get sparkle, plus full detail . . . one big difference between just a snapshot and a fine picture. This summer, make the most of your picture opportunities, with G-E flash, right around home, and on vacation too.

Remember, there's a G-E lamp for every photographic purpose

at 22 and 25 cents, respectively, for testing the efficiency of batteries, sockets and wiring connections in photoflash synchronizers. In checking, the condition of the batteries is indicated by the relative brightness of the lamp.

Two electronic flash units are announced by Epco Products, Inc., 2500 Atlantic Avenue, Brooklyn, N. Y. The Model LM-301, a 5½-pound unit that operates on AC house current, delivers 60 watt seconds of light at 1/10,000th second, and costs \$99.50. The Model LM-300 AC-DC unit operates on standard house current or can be converted to battery operation, and costs \$110.

A special strobe adapter cord for the Contax camera, by means of which any zero-delay strobe-flash unit may be used with the Contax II-A and III-A models, is now available at \$8.

Cameras

The 1952 model of the Practica 35mm single-lens reflex cameras has been imported by Kine Camera Company, 11 West Twentieth Street, New York. The camera is internally synchronized, has focal plane shutter speeds to 1/500th/second, automatic film transport, double exposure prevention, cyc-level sports finder, interchangeable lens mount and lenses with the automatic diaphragm feature. With the f/3.5 Zeiss Tessar lens, the camera is \$139.50; with the f/2.8 Zeiss Tessar, \$159.50; the f/2 Zeiss Biotar, \$199.50.

Sterling-Howard Corp., 561 East Tremont Avenue, New York 57, announces the new 1952 model Adox-Edinex 35mm camera with coated f/2 Rodenstock five-element Heligon lens. Other features include a Compur-Rapid shutter with nine speeds to 1/500th, internal synchronization for flash, depth of field scale on lens mount, enclosed optical viewfinder, automatic exposure counter, film transport that also counts exposures, removable back, and the price of \$59.50, \$5.50 for eveready case.

The Lentic, a portable instantaneous camera which can be used either in the studio or elsewhere for three-dimensional pictures, is announced by Lentic Corporation, 2 East Fifty-sixth Street, New York 22. The camera is equipped with six lenses to do the job, all lenses coupled. The camera is flash-synchronized, has a range-finder and shutter speeds from time to 1/100th second. It uses No. 120 film.

Services

E. Leitz, Inc., 304 Hudson Street, New York, now offers immediate repair service on Leica equipment to professional users of the Leica camera. Minor repairs can usually be completed the same day cameras or accessories are brought to the service department, the company promises, often within a few hours. More extensive repairs can usually be completed within three days. No extra charge for the fast service.

Pavelle Color Prints and Ansco color

Pavelle Color Prints and Ansco color transparencies processed by Pavelle Color, Inc., 533 West Fifty-seventh Street, New York, now regularly receive a treatment that prolongs their useful life up to ten times under normal recommended storage conditions, the company announces. The

3.1

improvement has been achieved through the use of a stabilizing solution that minimizes the discoloration and fading of color prints and transparencies caused by heat and humidity.

Eastman Kodak announces that Kodak Professional Sheet Film, the sale of which was discontinued in June 1951, will not be processed after July 31, 1952. After that date all processing facilities for this film will be non-existent.

Literature

Two spring issues, one for Leica fans, the other for moviemakers, are announced. The new Leica number features a discussion by Sey Chassler, of Collier's Magazine, on the advantages his magazine has found in using 35mm color transparencies. The issue also includes articles by Manuel Komroff on "A Bid for Sharper Pictures"; by Sophie L. Siegel, who describes Woodstock as a colony for artists in almost all creative fields; by Charles F. Muth on "Gem Fingerprinting With the Leica Camera" and by William E. Booth on fashion photography with the miniature. The magazine also announces new rates for one-time use of pictures. The magazine goes out regularly to registered Leica owners.

The spring issue of "Panorama", a Bell & Howell publication, features an article on "Filming Circus Thrills" by Oscar H. Horovitz, whose 16mm circus movie has won prizes twice. Other articles in the issue are "A Voice For Your Home Movies" (how to add a magnetic sound track to your film); "A House Warming Gift", "Invite Your Minor League to a Baseball Party", which includes plans for a children's party, and "Of Mops, Moppets and Movie Making", which records the adventures of a movie making mother.

"Let's Take Kodacolor Pictures", Eastman Kodak's latest informational booklet, has just been published at 35 cents. Written chiefly for the beginner who uses roll film cameras, the booklet treats fundamentals in simple language, making use of diagrams, sketches and 24 full-color reproductions of typical amateur pictures to illustrate the points made.

The first two English language issues of "Leica Fotografie", published in Germany and distributed in the United States by Rayelle Foreign Trade Service, 5700 Oxford Street, Philadelphia 31, are now available. Well illustrated, containing practical, esthetic and general articles, and printed on good stock, the magazine is highly popular among Leica users in Germany. The English translation appears in a loose insert of about 20 pages on thin stock.

The first popular booklet on the subject, "Tips On Making Your Own Magnetic Sound Movies", just published by Bell & Howell, is now available from dealers. The text includes step-by-step instruction in planning the sound movie, shooting the film, preparing a sound script and recording a magnetic sound track on film.

"Tables for the Contax", a 63-page book of optical data for owners of Contax cameras, has been made available by Carl Zeiss, Inc., 485 Fifth Avenue, New York. In addition to depth-of-field tables for all Contax lenses, the pocket-size handbook contains reduction scales for close-up work, the use of close-up lenses, data for using the focusing head accessory, and other information. The company also has a new, up-to-date listing of the more popular black-and-white and color film ASA exposure ratings in a handy booklet that is now being furnished with each new Zeiss Ikon Ikophot II-A photoelectric exposure meter. Dealers have free copies.

A new and improved Raised Letter Nameplate has been announced by Modern Sales Company, 210 Fifth Avenue, New York 10, N. Y. The name portion is solid metal, with a black stippled background and the frame is tooled from a solid block of blonde or mahogany wood, size 2" x 8". Available with easel or flat back, it accomodates a total of 21 spaces and is priced at \$4.95, postpaid.

NEWS AND NOTES

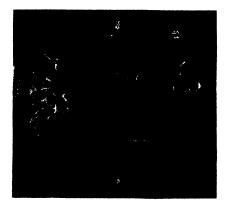

Serves You Right!

"Northwest photographers who have let their PSA memberships lapse deserve to turn green with envy if they are unable to beg or borrow copies of the March PSA Journal. The special section on color slide photography is absolutely tops, and almost worth the year's membership dues. Included with this issue was also the quarterly supplement on Photographic Science and Technique, containing many articles of interest to the technician."

---FROM APRIL "PHOTO NORTHWEST"

PSA Crests

Way up in northwest Ontario in Canada are three enthusiastic PSAers in the persons of Nelson Merrifield (left), Robert Soper (center) and Lloyd Small (right).

The trio have gone into color in a big way, spending their vacations at such spots as the Rocky Mts., National Parks of Arizona and Utah, Crater Lake, etc., making travelogues. To tell all and sundry that PSA membership is a matter of pride, they had crests made to wear on their jackets, as seen in the photo.

These crests have proved an "open sesame" wherever they have gone. Hotel and railroad personnel have extended many

WITH STEREO-REALIST

You Never Miss When You Choose The Best

A "whiff" in golf is funny only to those who don't add it to their score. But a missed picture is disappointing to everyone concerned. Because the REALIST Camera is so easy to operate, REALIST owners report fewer picture failures than with any camera they've ever owned.

The REALIST is the ideal personal camera because it exactly reproduces what you see with your eyes — in beautiful, natural color and thrilling, true-to-life three dimensions. REALIST pictures are so real they will live as long as you have eyes to see.

If you haven't discovered the excitement of REALIST pictures, ask your camera dealer to show you some. Then prove to yourself how you can "take it easy" with Stereo-REALIST. DAVID WHITE COMPANY, 387 W. Court St., Milwaukee 12, Wis.

STEREO Realist

PERMAMOUNTS

Specially designed for projection; 3 window sizes and spacing preadjusts silde and elimnates need for projector adjustments. Plasticglass combination is highly resistant to breakage. Neat, easy to assemble.

FILM IDENTIFIER

Eliminates possibility of losing valuable film. Puts name and address right on the film — using part of film otherwise blank. Convenient pocket size. Metal construction.

courtesies and considerations and they have served as introduction to other PSA members and photographers.

Ansel Adams' Workshop

Ansel Adams, FPSA, has announced that he will conduct an intensive course in practical and creative photography in two sessions of two weeks each this summer, July 7-19th and July 21st-Aug. 2nd, in San Francisco.

With emphasis on staff demonstrations, the Workshop will consist of instruction in contemporary techniques and esthetics, designed for professionals and amateurs, editors, journalists, and all persons to whom photography is an important means of communication and expression.

Information may be obtained from Mr. Adams at 131-24th Avenue, San Francisco 21, Calif.

Rose Color Slide Exhibition

The Fourth International Rose Color Slide Exhibition, sponsored by the Reading Rose Society and the PSA Berks Camera Club, of Reading, Pa., will be held in April of 1953, it was announced by the chairman, Blair M. Sleppy, PSA. The announcement was issued at this time so that color slide photographers may keep it in mind during the current rose-growing season.

Closing date for all entries will be January 18, 1953, with judging on the 25th and slides returned by March 1st. There will be the usual classes of one bloom, arrangements, and gardens, etc.

Requests for entry forms should be addressed to Mr. Sleppy, Berks Camera Club, 550 North 11th St., Reading, Pa.

It has also been suggested by the PSA Nature Division that any slides taken for the Rose Exhibition would be welcome for their travelling exhibits.

College Courses

Colleges and universities throughout the country are catching on to the need for courses in the science and technique of photography. The number and variety of such classes grow year by year.

Some of these courses—as in the case of the University of Rochester—have been initiated and guided by PSA Technical Sections; some have come about through keen student interest; others have resulted from the colleges' own desire to speed the use of visual education techniques.

Dr. Alan Valentine, former University of Rochester president, told an audience a short time ago that courses are offered in about 300 colleges and junior colleges. In addition, more than 500 high schools, about 100 trade and technical schools, and about 100 professional schools of various kinds include the subject in one form or another.

"Mahy leading universities have developed, as part of their educational programs, film-producing units," he added. "These serve a dual purpose: first, to educate college students in the art and technique of film making; and secondly, to experiment in the use of films for college teaching."

Among the universities which have "active. progressive photographic centers," he listed:

State University of Iowa, University of Missouri, University of California, University of Indiana, Ohio State University, Pennsylvania State University, University of Minnesota, University of North Carolina, University of Nebraska, University of Texas, Syracuse University, University of Wisconsin, Western Reserve University, and Iowa State College.

Some universities specialize in the development and use of medical films. These include Colorado, Illinois, Northwestern, and Duke.

Important research in films for medical purposes is underway at the University of Rochester, with Eastman Kodak Company assisting.

Institutions like Rochester Institute of Technology are doing outstanding work in teaching photographic skills.

In quite another field of visual research the Institute of Optics of the University of Rochester is a leader.

Purdue University has produced films to teach the draftsmanship; the University of Missouri to meet agricultural needs; the University of Wisconsin for state-wide work in adult education.

All in all, education by and for photography is on the gain.

PERCEPTION . . .

MENTION INCREASINGLY is made in the current literature on art, including photography, of the importance of perception to the creation of pictures. The dictionary defines perception as "awareness, consciousness, knowledge obtained through the senses."

THE PHOTOGRAPHER develops perception. Undoubtedly, the beginnings of perception induce him to use the camera in the first place. Initial technical facility assured, he begins to notice the effect of light and of shade. Perhaps his first glimmering of perception is that, lacking light, the world is duller, photographically speaking.

PERCEPTION IS, and necessarily, a major attribute of the artist. Unless he has perception, he sees, or perceives, little more than others. Consequently, he has little to say. Indeed, if he cannot see, and know, and feel what others miss, there is little reason for him to say anything, especially in pictures.

Photography being a medium of communication, the complete photograph must convey a message. The more comprehensive the message, the greater the picture.

THE AVERAGE PHOTOGRAPHER, seeking to improve the quality of his work, can find a lesson here. That photograph is superior which is emotionally expressive. It sees and says something which has escaped the notice of the casual observer.

A WISE MAN once said: "Never make small plans. They cannot stir the minds of men." Hitler had much the same, if twisted, idea in making his remark that the big lie becomes believable. It is the big perception, product of the deep-seeing, aware mind, which makes the great photograph—and stirs the minds of men. VHS

PSA CONVENTION NEWS

Motion Picture Program

Ernest Wildi, program chairman for the MP Division part of the PSA Convention in New York, August 12–16, announces that the latest in stereo movies will be demonstrated by Floyd A. Ramsdell, of the Worcester Film Corp. His demonstration will be accompanied by the projection of new three dimensional films never before shown anywhere.

Rounding out the presentation of developments in this new field will be another demonstration showing how to make stereo movies with present 16mm equipment. Several new amateur stereo films will be projected.

Another outstanding feature will be a program devoted to magnetic sound on film, from which the audience will learn by actual participation.

Prize-winning amateur films and motion pictures taken under water by Prof. John F. Storr, Adephi College, will also be shown. Prof. Storr will not only project color movies and stills of the exciting life on the floor of the ocean, but he will also explain how he made his pictures.

Also scheduled to present a paper is H. A. MacDonough who will show how to make vacation movies without expensive equipment

Technical Division Program

Five days of research papers, demonstrations, and discussions of many aspects of the science, technique, and application of photography have been scheduled by the PSA Technical Division for the Society's New York Convention at the Hotel New Yorker, August 12 through 16th.

The complete program of TD follows:

Tuesday, August 12th.

9:15 AM—Symposium on photography in medicine and biology. "What is Medical & Biological Photography" by Dr. Milton G. Bohrod, Rochester (NY) General Hospital. "The Changing Ideology of Medical Teaching Motion Pictures," Dr. D. S. Ruhe, Assoc. of American Medical Colleges. "Photography in Medical Research," Dr. M. W. Chase, The Rockefeller Institute for Medical Research.

"Applications of Photography in a General Hospital," Leonard A. Julin, Mayo Clinic.

"Modern Photomicrography," Dr. O. W. Richards, Amer. Optical Co. "Place of Photography in Ophthalmology," Dr. D. M. Gordon, Cornell. "Elimination of Shadows in Macrophotography," Louis J. Dogin.

"Application of Color Photo. to Cleft Lip & Palate Research & Training Program," F. T. Sharp, U. of Ill. "Autoradiography," Dr. P. J. Fitzgerald, Sloan-Kettering Inst. "Close-ups in Insect Research," Roman Vishniac. "High-Speed MP Photo. & Human Subject," J. H. Waddell, Wollensak, and others.

Wednesday, August 13th.

9:15 AM—Symposium on photography in engineering and science. "Photo. of High-

PSA JOURNAL, Vol. 18, June 1952

Now specially adapted for 16mm sound fil

Perfect companion for your new **Filmosound "202"** ...latest **Bell & Howell** 70-DL movie camera

You're ready to make low-cost sound movies with a new Bell & Howell 70-DL!

This famous 16mm movie camera now takes single-perforated film . . . onto which the amazing magnetic sound track can be added. This track will last the life of the film, yet can be changed any time.

When you compare features, note the 100-foot film capacity, the 22-foot film run, the turret head that places three lenses at your fingertips, seven speeds including sound speed, parallax adjustment that corrects from infinity down to

You buy tor life

3 feet, and the positive type viewfinder that lets you see what you take. Remember, too, every 70-DL is guaranteed for life.

With 1-inch f/1.9 lens only, \$365.50. For further information. see your Bell & Howell dealer. And be sure to ask about the new Filmosound 202 recording projector.

And here's a suggestion! Why not have a demonstration of the Filmosound 202 using your own sound film. In this way, you can prove to yourself the worlds of exciting possibilities that exist in making your own sound movies.

when you buy Bell & Howell

FREE SOUNDSTRIPE* of your first 100 feet of single-perforated film - that's what you get when you buy a new 70-DL . . . or have your present model 70 adapted. This is a special limited-time offer made by Bell & Howell to acquaint you with this wonderful new way to make sound movies.

Good news for present owners of B&H 70's

If you already own a Bell & Howell 70 camera, you can have it adapted to take single-perforated film as well as regular double-perforated film. This brings your camera right up-to-the-minute in usefulness. This is a factory conversion which you can arrange for through your Bell & Howell dealer for just \$15.95. Same "free" Sounderairs offer applies.

*Soumszarz-the magnetic iron oxide stripe applied to single-perforated 15mm mo film for magnetic sound recording.

Prices subject to change without notice.

PD Convention Program By Samuel Grierson, FRPS

Doris Martha Weber, APSA, one of the leading women photographers in amateur circles, is Convention Program Chairman of the Pictorial Division, and as such is getting together a most interesting and well rounded series of events and lectures for PSA's first Vacation-Time Convention, August 12th to 16th in New York.

She is secretative concerning her pet presentation to be called TRIAL BY JURY. This event is supposed to surprise every-

FACTS ABOUT THE 1952 PSA INTER-NATIONAL EXHIBIT TO BE HELD IN CONJUNCTION WITH THE CONVENTION August 12 to 16th, New Yorker Hotel, New York

Seven divisions will be represented in the exhibit.

Deadline for all entries is July 10, 1952. Entry fee is \$2, with checks to be made payable to Frank J. Soracy, Treasurer.

All entries except those for the Technical Division exhibit are to be sent to: PSA INTERNATIONAL EXHIBIT, c/o PRE-CONVENTION HEADQUARTERS, MASTERS INSTITUTE, 310 Riverside Drive, New York 25, N. Y.

Technical Division entries must be sent to Earl R. Clark, 184 Malden St., Rochester 13, N. Y. This division will distribute its own entry forms and will assemble and judge its own exhibit. Entry forms may be obtained from Mr. Clark.

Motion Picture and Photo Journalism division exhibits will be invitational.

Entry forms for the other four divisional exhibits will be mailed to all PSA members, and others, from Philadelphia PSA headquarters. Those who do not receive entry forms may obtain them by writing to Pre-Convention Headquarters in New York or PSA Headquarters in Philadelphia.

Judging is scheduled to take place in New York, July 14 to 20, with the following juries:

PICTORIAL—Adolf Fassbender, Hon. FPSA, Hon. FRPS, Hon. M.Ph.; Helene Sanders, FRPS, FPSA; and Harvey Falk, APSA.

COLOR SLIDES—Frank E. Fenner, FPSA; Harry Haimes, APSA; and Joseph Breitenbach, ARPS.

NATURE—Samuel Dunton, Staff Photographer and Director, Bronx Zoological Gardens; Otto Litzel, President, Hypo Club; Dr. Roman Vishniac, Ph.D. Zoology, Biological Photographic Society.

STEREO—Paul J. Wolf, APSA; Bart Brooks, professional stereo photographer; and J. A. Norling, APSA, stereo engineer. body and it will. The cast will be composed of J. Philip Wahlman, APSA, the judge, Robert L. McFerran, APSA, the prosecutor, and Dr. Carlton J. Marinus, APSA, the defense attorney.

J. M. (Jake) Endres will speak on PHOTOGRAPHY, A GRAPHIC ART. During his talk he will demonstrate the making of genre pictures. This man has written some excellent articles on the subject. His own pictures have won him many medals and honors and he is extremely popular as a print judge.

Josef Schneider, whose baby photos must be known to everyone as they are always turning up in advertisement in the alick paper magazines, will talk on OUTSMART-ING BABY. Schneider is a well known speaker in the New York area and those who have heard him sing his praises.

PORTFOLIO MEMBERS' POW-WOW is a new feature presented by popular demand. No portfolio commentators will be present at this; just those who have prints in the PSA Portfolios. And these people can let their hair down and say out loud what they think of the deal and of the commentators! It will be a lot of fun and maybe some improvements will result. Director Eldridge R. Christhilf and General Secretary Doris Martha Weber will preside.

Boris Dobro, APSA, an instructor at the Brooks Institute of Photography in Santa Barbara, California, will come all the way to New York to speak on TECHNIQUES OF PICTORIALISM. He will illustrate his talk with lantern slides and emphasize tone separation. He will also discuss the various types of montages. As well as being an excellent instructor, Mr. Dobro is a noted salon exhibitor.

No one is a better authority on dog photography than Arthur S. Mawhinney, FPSA, and Katherine Holt Mawhinney, his wife, is just as proficient. Their fine book, "Gallery of American Dogs," is a delight to both dog lovers and photographers. This couple will demonstrate the art of picturing dogs, using live models. This should be fun for all and, of course, educational too. Mr. and Mrs. Mawhinney, as many know, work with a Leica. They broke into photography with that camera and have stuck to it right along.

Lejaren a Hiller is on the program scheduled to speak on LIFE AIN'T A BED OF ROSES. Mr. Hiller says he does not care to talk of his successes—prefers to dwell on his failures instead. Naturally he will stress the humorous angles and the event promises to be entertaining.

Adolf Fassbender, Hon. FPSA, will trace pictorial progress in a talk entitled PICTORIALISM THROUGH THE YEARS. Mr. Fassbender is the right man for this, some even calling him the Dean of Pictorialism.

Other features on the program will include Wood Whitesell, FPSA, who does wonders with bromoil, a symposium on WHAT MAKES A PICTURE PICTORIAL? with John R. Hogan, P. H. Oelman, Arthur M. Underwood, J. Philip Wahlman, and Peaslee Wright taking part, and a Commentator's Conference.

And Miss Weber has other ideas to add to all of this!

PSA JOURNAL, Vol. 18, June 1952

DOUBLE Your Picture Opportunities..!

DOUBLE Your Camera's Usefulness..!

with GRAFLITE FLASH! it fits almost every camera!

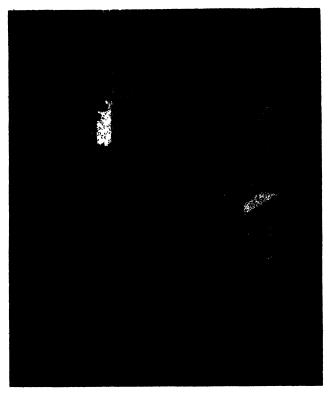

Any time . . . any place . . . any weather . . . Graflite helps you get prize-winning pictures! It's the famous interchangeable Graflex flash unit that fits almost every camera . . . the one flash outfit with unlimited versatility to meet the most exacting requirements. Single or multiple flash, with synchronized or solenoid operated shutters, whatever the need, Graffite is the answer!

Only Grafite combines the multi-purpose circuit controller, "snap-on" viselike grip, micro-type click action switch, multiple outlets with standard household connections, reversible heavy duty clamps . . . all of which add to efficiency and convenience. Get the full Graflite story from your Graflex dealer today! He'll show you why it's the finest, most versatile flash unit you can buy!

Shooting New York

JACK A. GOLDSACK

HANOVER SQUARE

Jack A. Goldsack

You've undoubtedly seen many good photographs of this great city made by amateurs like you and me. The chances are that a large percentage of the fine shots are made by visitors rather than native New Yorkers. The reason, of course, is that amateurs prefer to go far afield in their search for inspiring material.

As an enthusiastic amateur who has lived in this fabulous city for over 40 years, photographically for the past 20, perhaps you can profit from this experience when you start unlimbering your shutter finger this August at the Vacation-Time Convention.

No city, but no city, offers more or a greater variety of subject matter. In fact, the choice is so great it would be a time-saver to choose your spots in advance and set up a shooting schedule. Otherwise you'll be swamped with places to visit and record. And incidentally, there is no reason why you can't combine your shooting with sightseeing.

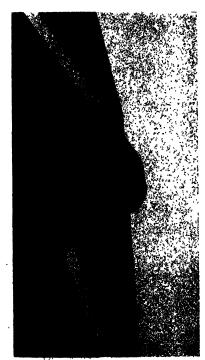

Beginning at the south end of Manhattan Island you'll find the famous Wall Street with endless opportunities, including the waterfront, in that immediate vicinity. Then work your way up thru Chinatown, The Bowery, Fulton Fish Market, Little Italy, and the Lower East Side with its pushcarts, clothes lines and gossip. From there you

change the pace and visit quiet, quaint Greenwich Village. Moving further uptown the Empire State building will demand a halt and more than several exposures. On to Radio City, the United Nations City and you've covered the photographic high spots of only half of Manhattan.

From there you can proceed thru Central Park, the great zoos, the lush, plushy upper east and west side, the museums and on into Harlem, the Negro metropolis. Of course, you can shoot the entire Island from the top of either the Empire State Building or Radio City. And if you like to focus on people, take your choice of 8,000,000 in this melting pot of almost every race on earth. The above by no means includes everything but merely outlines a few suggestions.

Light in mid-August is excellent. Weather is comparatively mild, ideally suited to picture-making in both black and white and color. The numerous field trips planned for Convention visitors will take in some of the material outlined above. Transportation facilities are fast and ample by subway, el and bus and you'll have no difficulty reaching any of the interesting spots you decide to see and shoot.

Now let's consider some of the problems you'll encounter, if indeed they are problems, when you go forth for those prize-winners. Working mid-town or downtown Manhattan, your best bet will be to get out early in the morning before this turbulent city begins pulsating. Early morning light in August with a slight haze is

Profile: U. N. BUILDING

Elizabeth Meigs Eidlitz

PSA JOURNAL, Vol. 18, June 1952

usually excellent, even for color. If you are determined to disregard this advice, preferring to sleep, you're bound to be hamstrung in many places by cars, buses and people. Dense traffic will make it difficult to approach many fine spots for inshooting. But don't get the impression Manhattan cannot be photographed during the day. It's just that much easier to do it in the early A. M. Besides, shooting early in the morning will leave you the greater part of the day to take in Convention activities you won't want to miss. It's a good way to plan your days.

Nothing thus far has been said about shooting pictures at night. Here a whole new field is opened up to you. You'll find plenty of buildings brightly illuminated with water foregrounds for those scintillating reflection shots. And if you've never experienced night turned into day you have a treat in store when you see Broadway's Great White Way. Imagine making virtual daylight exposures at night of interesting and fascinating material.

One could write many pages on the picture possibilities on Manhattan Island alone, the world's biggest little Island, and spend many weeks photographing the exciting places in this perpendicular city. Black and white workers will have no exposure problems. Color will require care. Due to the short range of color film, it's conceded to be about 1 to 4, you'll have to use your head when you use your meter. What do we mean by a range of 1 to 4? Simply the difference between your highlight and shadow reading. If your highlight reads more than 4 times the shadow reading, theoretically the picture is beyond the range of color. You can stretch that range

BOWERY
Bernard Gorson

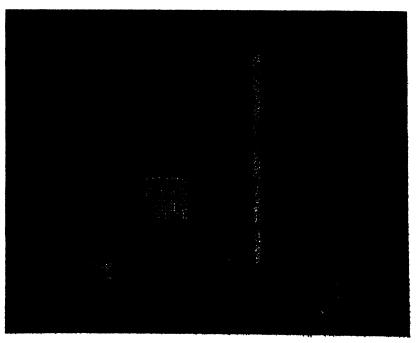

EAST RIVER

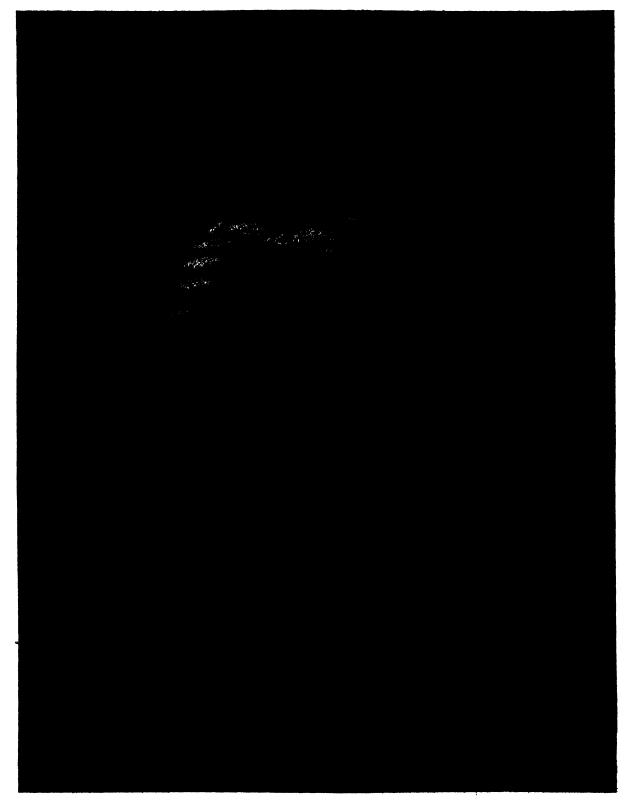

Arthur G. Banta

some and still come up with excellent color shots. I've been thumbing my nose at this theory for years and getting away with it. The reason it's mentioned at all is that tall buildings and narrow streets create contrasty lighting. But your field trip guides will be prepared to help you lick any exposure problems in New York.

Needless to say you need not load up on film when you come to this photographic mecca. Some of the world's greatest and most exciting photographic stores are within a couple of blocks of your hotel. Just bring your cameras and come prepared for the time of your life as well as the finest negatives and slides you've ever made. The many committees and hosts at the Convention will see to that,

Nuts to the Judges

C. STANTON LOEBER, FPSA

At the time of C. Stanton Loeber's passing, which was announced in the July 1950 issue of PSA JOURNAL, the manuscript of this article was in our files awaiting publication.

Stan was a prominent figure in pictorial photography, and there are many who will recall his delightful pictures and his occasional contributions to photographic literature.

But bigger than Stan Loeber, the artist and author, was Stan Loeber, the man. He was never happier than when surrounded by members of the photographic fraternity, and his desire to help others was unsurpassed. To say that he is greatly missed is but to recite the obvious.

In presenting Stan's final contribution to the JOURNAL, we thus pay tribute to his memory. But his pictures and his message will convey more to his many friends than our feeble expression of a severe loss.

W. DOVEL LE SAGE, APSA Pictorial Editor

"Aw, NUTS! Phooey on the judges. What do they know anyway? Nuts to the judges—all of 'em."

It was during my first bull session after joining the club that I heard this bit of sour grapes. The cynical remark shocked and irritated me. Such lack of respect was almost like the use of an unmentionable epithet in connection with one's mother. I wanted to smack the speaker in the eye. But I didn't. For I knew that I was pea-green, and didn't have the right to poke anybody in the eye. Too, I might get smacked back. But it did teach me one thing: Never to sit at a judge's feet, with mouth wide open like a fly trap, drinking in each word as if it were nectar.

Shortly before joining my camera club, I had sent prints to my first salon, and immediately after signing up, learned the results of my entry. Yipee! Not only had I made the salon, but I won first award as well. Boy! I was as thrilled as any high school "Freshie" at her first dance. Now I was a salon exhibitor.

So, of course, a copy of this winner was entered in my first club competition. Maybe I felt cockier than anyone in the club, and my chest stuck out like a pouter pigeon's, as I strutted about. For wasn't I a cinch to get first award? There were only twenty-odd prints entered, and five awards to be made. Sure, I was a cinch for something.

And then the judge came in. An awed hush settled over the gathering. He had quite a "rep" for himself, and I was properly quiet. But nuts! This fellow wanted to talk before he judged. As he talked, my feeling of buoyancy began oozing. Then he started judging. He went over the prints so fast that he reached "Granny" almost before I knew it, and on to the next print. My heart had stopped beating. "Granny" hadn't won first place. In fact, she hadn't won a single, solitary thing. She was out on her ear. It was terrible.

"Wrinkles too plain," the judge had said, "and too much shadow." And further, where did the maker get the idea of cropping like that? "Looks like I'm being kidded," he scoffed. "Someone is trying to see if I'd take that for a human being." There may have been more. I

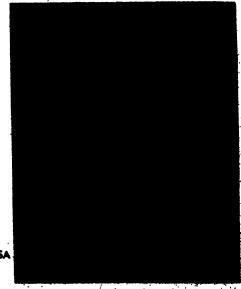

never knew. But as he chuckled at his own dim sense of humor, I felt rather miserable. Then and there, I agreed with the remark: "Nuts to the judges."

That was a long time ago. Perhaps "Granny" wouldn't be so hot in a salon now. Better work is being done every day. But hers was a rather new method then. The drastic cropping and the almost brutal treatment of wrinkles and skin textures were a direct result of the first salon I had ever seen. And the cockeyed judging I had just witnessed was due to the judge's provincialism. He had not learned the newer trend in character shots. But he did ease some of the hurt when he gave first award to another print of mine. However, in my immature opinion, it wasn't in the class with "Granny." But I was very green then, and hadn't learned, as yet, just how screwy judges could be when they really worked at it.

Some have far more whims than any beauty has curves. Every camera bug knows that. Even the judging in the country's top salons sometimes makes one boil up—even spill over. Your friends gripe. They won't send to the Twelfth Annual Stinkaroo Salon this year. No sir! Isn't Joe Zilch on the jury, and wasn't he on the jury that tossed out all four of their prints last year? And doesn't just thinking about him give one a pain in the neck?

Even judges know that they should rid themselves of prejudices. But many of them are still as stubbornly prejudiced as any army mule. Decisions should never be made just because of likes and dislikes. But they are. Any judge should be able to justify his decisions at any time. But are they?

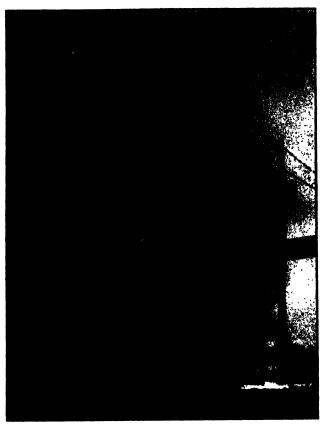

And isn't any entrant more important to the salon than a "name" judge? His pictures and his entry fee make salons possible. Without him there would be no salons. So he should receive the fairest judging possible. Unless

PEACEFUL WATERS
C. S. Loeber, FPSA

PSA JOURNAL, Vol. 18, June 1952

thoroughly grounded in photography, no painter nor sculptor nor etcher should ever be asked to judge photographs. He isn't good enough. Nor should any water-colorist be on a jury—no more than a hog caller because he has a strong voice and surely would be heard. Nor does it follow, just because one has been successful in salons, that he is going to be a good judge. A judge should study carefully the science of being a judge. He doesn't just grow up to be one.

RIVALS

C. Stanton Loeber, FPSA

This first judging was rather startling. But it was as nothing to the crackpot stuff I was to witness later on. That was a thing never to be forgotten. It simply shows the utter confusion that exists in the minds of many of our judges, especially camera club judges.

After judging the evening's prints, the judge was asked which print he considered best of the show. Now, mind you, there were only two groups of competitors—Advanced and Beginner. It should have been duck soup for anybody. Automatically, it should have been one of the two firsts in the advanced and beginner classes. But what did the judge do? He went carefully over the entire show and then, to the consternation of everyone, picked out a print to which he had not previously paid the slightest attention. It had not received even a lowly honorable mention; not even the remotest recognition. We were are are acceptable of the show.

But there it was—best print of the whole show. The judge had said so, and his was the final word. However, a snicker of derision rippled through the crowd. Do you wonder why this title: "Nuts to the judges"?

Often a club has among its membership many as good or better than nine out of ten of the judges that the same club is able to secure from outside sources. Is it surprising that there is criticism?

But let's get back to "Granny." As I've said, I was green then—greener than sour little apples. And stubborn, too. Anyway, this other print that had gotten first place over "Granny" was sent to a salon. And because I didn't have another print, "Granny" went along too, just for the ride.

But what happened then nearly knocked me for a loop. I was almost breathless from surprise. This other print was kicked out, but "Granny" made it. And she was an honor print, too. It flabbergasted me. After that, "Granny" went to all the salons. And she hung in most—the Oval Table of New York, the Royal of London, in Detroit and in Baltimore. And what about the other print, which my first judge declared "tops" while he threw out "Granny?" Never made a single salon! Finally I retired it.

Do you wonder that shutterbugs often say: "Nuts to the judges"? Sometimes they give some rotten judging. But what can a club do? We even tried three judges, on the theory that the extra numbers would balance out the faulty decisions. And it worked well—just as long as we had at least two capable jurors. But this used up the good jurors even faster than before. Think what it would do in small towns, where there is not the choice that we have in a large city.

I've had some of my best prints totally rejected in smaller salons, whereas the big shows took the same prints most regularly. Perhaps there is no answer to it, but our judging is mighty spotty.

I've known a judge to wear strong glasses so that the makers' names signed to the prints would be more legible. And I've even heard a juror remark sotto voice to the judge beside him: "I live here. Let's give the local boys a break."

True, all this smacks of dishonesty. But after witnessing much judging, I believe that actually there is very little dishonesty. It's just a lack of knowledge on the part of the judge as to what constitutes a good print.

For a while the idea of making character studies obsessed me. Even my friends were bitten by the bug. Let any old bum pass us, and they'd get all steamed up. "Look, Loeber!" they'd whisper as they nudged me. "Character shot!"

Bah! No idea as to what constituted a character study. They never learned the score, any more than the judges. Only old men appealed—old men with whiskers and ragged clothes.

I'd fool 'em, I thought—principally the camera club judges. But I didn't very much. I made a picture of a seventeen-year-old kid, sans whiskers and sans wrinkles. But the cockeyed camera club judge tossed it out. But first he swallowed hard as he searched for words. He even tried to re-frame it drastically. He tried cutting off most of the head above the hairline, and chopping off from each side and the bottom. But he gave it up. All he said was: "It needs cropping," and passed on to the next print.

As I've said, bum judging is old stuff to any camera clubber. For example, Dorothy A. Lineer is one of the

nation's best animal photographers. Because her pictures are of that perennial favorite, pets, she is nearly always a cinch for first award at the club. But I've often wondered how a certain cocky judge must have felt, when he found out the immense popularity of one of her prints which he had given a turn-down in the club. Detroit used it to adorn its salon catalog and for its stickers. I don't think a salon ever gave it the red light. But all our cocky judge said was: "I never liked pets," as he turned her "Protected" down cold.

The vice-president of our club had a honey. What happened? Even a telescope would never have brought it to the judge's sight. He just couldn't see it. But Graflex bought it, and for months it was a vital part of their advertising.

Now, just peek at "Rivals." Surely those blackhearted judges couldn't refuse this masterpiece, with that exciting black smoke being belched all over the print. And sure enough, the club judge gave it top honors. But that was only in the club. I had much more respect for a salon's opinion. So out it went while I gnawed my nails in suspense. Finally a letter came from the salon committee. Boy, I was jittery! Like a gal just about to receive her first kiss.

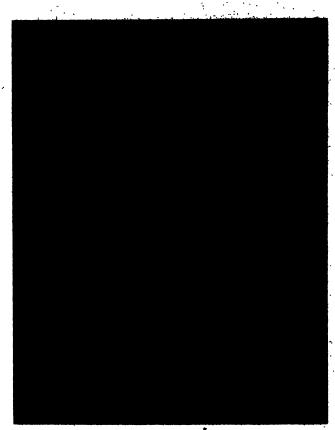

The jolt nearly knocked me off my feet. "Rivals" was one of the two prints that had received unanimous acceptance. I walked on air. Again I sent "Rivals" to a salon. But no jolt. At least not one that I liked. It had been turned down. But I tried again. And again it failed. How many times I sent it out, only to have it rejected, has been lost in the dim recesses of forgotten things. But "Rivals" never hung in another salon. Who was screwy this time? I could never figure it out.

Sometimes a judge does help, though. "If the maker of 'Peaceful Waters' will go back and wait for something to happen," one said, "he can very likely have a winner. As it is, it makes a fine background, but not a picture. It lacks life-motion. Not even a center of interest. If it were mine, I'd try it over."

He may have said more. I don't know. I was too busy trying to visualize something happening out on that water. However, I did go back. I got what I thought was a fine picture—"The Channel." But the camera club judge had only half an eye that competition. First place went to a totally uninspired and uninspiring aprint that lacked a center of interest, had no life of any kind, and was completely static. However, he did grudgingly hand me a second award. Sure! I was robbed. But that had become a habit, by now, and didn't excite me too much. Aren't judges cockeyed, though?

Certainly, judging is a tough racket. But you like it, don't you? And have you ever thought of the poor baseball umpire? He's a judge, too, you know. But I've never known a camera addict to start a Donnybrook. Have you?

Someone will always try to knock you off. And no matter how much you think you know, you're bound to pull some burn judging, bound to make enemies. Sure, your neck is out. But wise up! Don't be so cocky. Soften your comments. But, on the other hand, don't always act as if you are talking to your Sunday School superintendent—nor to a bunch of half-wits, either.

GRANNY

C. Stanton Loober, FPSA

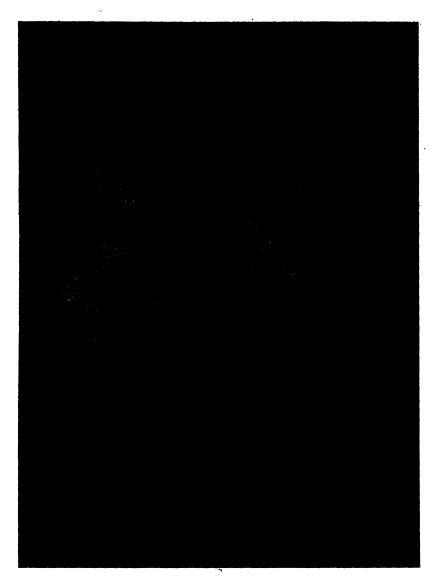

But sometimes I wonder, even though most of our clubs frown on popular voting. Just look at any salon hanging on a wall in some musty art gallery. Most of my friends agree with me that a good ten per cent of all prints there could have been refused, and a better exhibit would have been the result. And those same friends are surprised when they see the rejects hidden away, where no one will ever see them, that certainly among them are another ten per cent that are as good as anything in the salon. So why is popular voting looked down upon?

I recall that time when a bunch of prints were sent to me to judge, and how I took days to study them and make my final choices. I was the great expert!

And then I turned my gang of kids loose upon them, just for the fun of it. They ranged, in years, up to fourteen. Well, in a mighty short time they had their choices made, and handed me the list. They shocked me. They picked a list that nearly coincided with mine in every detail. And I had thought that I was good! It makes me laugh, now. What's wrong about popular voting? Are people dummies? Or are the "experts" afraid to let them try?

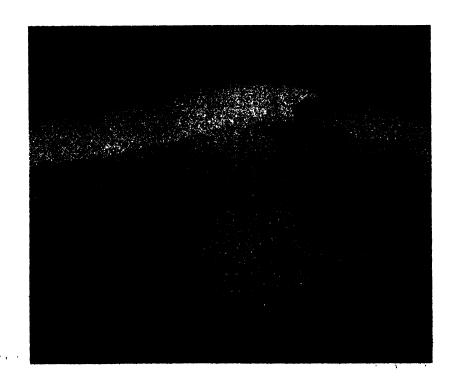

Just how does a jury decide what kind of prints to include in a salon? Does humor justify their inclusion? Or so-called human interest shots? Pets, just because that's what they are? Or babies, because all the world loves a baby? Just what do we want in our photographic exhibits? Or should a basic understanding of art principles be present in all these prints?

But I do know one thing for sure. And my kids taught me that. I'm not an expert any more. Just a layman, like everybody else. Every old-timer learns that eventually, if he lives long enough.

Camera Club Manual

H. J. Johnson, FPSA

For newer clubs we can point out that this revision follows closely the original manual edited by Victor Scales, Hon. PSA, in 1945. At completion of the revision, each PSA club will receive a new copy of the manual for its library. Chapter IV, is continued here.

3. Year Book Project

Preparation of a club Year Book is an activity affording many advantages, sound photographic training, and interesting possibilities. Many different routines may be followed, but one of the more effective is to organize a Year Book Project with a director who will enlist the participation of members and carry the activity through to completion.

Each participant agrees to prepare a certain number of identical prints from a favorite negative. Usually the total number of prints prepared by each participant is that of the number of members participating, plus two. On an announced date the participating members bring their prints to the club. The prints are turned over to the Year Book director for collating and binding. Each print is autographed by the member making it, so that the finished Year Book becomes a souvenir of club life, a record of club abilities, and a completed project.

Usually prints are made on double-weight $8 \times 10^{\prime\prime}$ paper. With vertical pictures a one-inch margin is provided along the left-hand border to allow space for binding. With horizontal pictures, the one-inch border is placed at the top. Members autograph prints, in India ink, in lower right-hand corner, and place the title in the lower left-hand corner.

Prints are bound, loose-leaf or spiral style, in hard covers. Some clubs prepare a title page, giving the name of the club, address, year, title of Year Book, and names of members participating. The cost of the activity is governed chiefly by the cost of binding. A standard ring binder is economical. More expensive, but also more attractive, is plastic or spring-wire binding. The title page may be drawn and photographed, or it may be printed, at greater expense.

Each participant receives a bound copy of the Year Book, in which appear his print and the prints of each of the other participants. Each participating member pays his share of the cost, which normally ranges from 75¢ to \$2 per copy.

The two additional prints made by each member are used to complete copies of the Year Book for the club library. If a larger number of additional prints are made, and books are bound, they may be sold at auction or full a fixed fee to non-participating members.

Announcement of Year Book projects and enrollment for the activity may be undertaken early in the club season. Later and repeated announcements warn members to complete and to turn in their prints well in advance of the closing date. Difficulties usually attend

the collecting of prints and completion of the books unless committee and chairman are persistent.

All club members should be invited to participate, but the number of prints actually included in a Year Book should be limited to about 24. Additional prints make a bulky and unwieldy volume. Large clubs may find it advisable to develop simultaneous year book projects, or to find some type of binding which will accommodate a larger number of prints.

Delivery of the Year Book to the participants may be made the reason for a special occasion, or may be undertaken at the annual dinner, or at the time of presentation of honors and awards. In this way a larger number of club members simultaneously receives something tangible from the club.

4. Studio Activity

Either a continuing Studio Activity, or occasional studio sessions, may be held in the club's own rooms if facilities are available, in a rented studio, in a studio loaned for evenings, or on visits to studios of friendly professionals.

Club members benefit from observation of the nature and use of studio equipment, and from taking portraits and still life pictures under conditions of controlled lighting. The average club member seldom has opportunity to work in a completely equipped studio and thereby to learn the fundamentals of lighting, posing, placing, measurement of exposures, etc.

Attendance at studio sessions should be limited, with 10 members about the maximum. Fairness is assured if members, upon entering, draw numbered slips, thereby establishing rotation for their turns in shooting positions, in posing the model, in arranging the lights, and in handling other details. Difficulties customarily arising from rivalry for the preferred shooting position may be obviated by chalking a semi-circle on the floor, numbering shooting positions thereon, and giving the members opportunity, in order of numbers drawn, successively to occupy these positions.

Using the club studio, or renting a studio for a series of evenings, usually is preferable. The cost should be low and equally shared by participants in the activity. In visits to the studios of professionals club members should be reminded they are using private property and equipment with which the professional earns a living. Equipment of a studio is expensive and breakable. Lights burn out rapidly. The professional should be remunerated, either in cash or kind. His equipment should be put back in place at the close of the session and the studio restored to order.

Many professional photographers are interested in amateurs and are willing to show them the ordinary methods of posing and lighting subjects and models. Studio Activity directors consequently may be able to make

arrangements whereby the professional, for a reasonable fee, will act as instructor for the activity and permit club members to use studio and equipment.

This activity lends itself well to portraiture, costume, figure, fashion, still life, advertising, and industrial photography, all particularly beneficial for any club. As in the case of field trips, completion of pictures taken at studio sessions should be encouraged. One means to this end is making the exhibition of at least one completed print from any session a requirement for participation in others.

The cost of studio sessions may be reduced if members take turns in acting as models. An experience, however brief, as a model is enlightening, especially if the amateur is inclined to be overly deliberate in his operations, or overly demanding of the model. Subjects for still life, advertising, and other types of pictures may be brought to the studio by members, or selected from spare material usually to be found on location.

Beginning photographers usually reach the point where photography of nude models is of interest. A photographic studio, with a professional photographer introducing, posing, and lighting an experienced figure model effectively serves this customarily transient interest of the amateurs, assures propriety, and teaches the necessary lesson of the vast difference between figure photography and making pictures of a naked model. Sooner or later, club members discover that photography of the nude is particularly difficult, tire of their efforts, and are ready for other photographic efforts. To this end alone, the Studio Activity serves a useful purpose.

Club officers should inform themselves of state and local laws governing figure photography and should plan carefully to observe these widely varying statutes. Otherwise the club may find itself a violator of "blue laws" of which officers and members may have been unaware. There is no general law. Basically, statutes prohibit posing in the nude for public viewing; permit posing in the nude for bona fide private supervised classes which offer instruction in art. Safety suggests that the session be exclusively for club members, with no guests permitted.

5. Process and Control Activity

Endless argument between the "purists" and those who preach or practice processes and controls, may be directed into useful channels by organizing a club Process and Control Activity. Here the members who seek to obtain the utmost in effects and control may practice, argue, learn the secrets of chalking, paper negatives, mediobrom, retouching, etc., and find enjoyment and education.

6. Portraiture Activity

Portraiture being basic in photography, and necessary training for beginners and advanced amateurs, organization of an activity in the field of portraiture serves many useful purposes, whether conducted on an organized basis throughout the year, or taking the form of occasional portraiture sessions with adequate equipment, lighting, and models.

This activity is highly adaptable, can cover slides or prints, and can have many variations. In its simple form it becomes merely practice in making portraits, with the participants led by a competent activity director through the various basic stages. Variations permit the introduc-

tion of the different art ideas, possibly by inviting advanced amateur or professional portraitists to demonstrate their favorite lighting and posing.

One helpful project for the activity is the preparation of a set, or book of portraits of members of the club. This project easily may be linked with the Studio Activity's program.

There is no lack of interesting undertakings for a Portraiture Activity. Indoor portraiture may be followed by outdoor portraiture, formal poses by informal, with costume and character poses, self-portraiture, special effects, and other projects offering large choice.

7. Motion Picture Activity

The still camera club may find that, in grouping members interested in motion as well as still pictures into a Motion Picture Activity, it has provided not only an organized interest for the group but an interesting program feature for the entire club. Participants in the activity will be interested in field trips, studio sessions, and other events. Their interest may induce them to make a motion picture record of club undertakings.

A competent leader guides the participants in producing motion pictures possessed of all the art qualities of stills. Exchange of information between those practicing still and motion picture camera technique can be helpful.

Ultimately this activity can develop into a separate Cinema Section of the club.

Cinema clubs can develop an equivalent activity for color slides.

8. Exhibition Activity

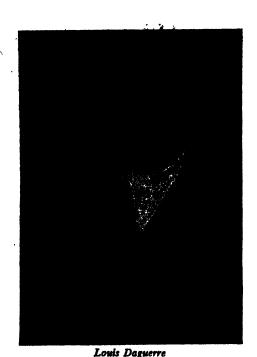

This activity supplies an organized effort to encourage capable members to seek recognition in exhibitions and competitions.

It obviously is designed to serve the interests of more advanced members, as well as of the club, by establishing what might be called a club team with a training table. The director of the Activity, preferably an experienced exhibitor, can do much to interest participants in the methods and ethics of exhibiting, and in viewing and studying the results of recognized exhibitions.

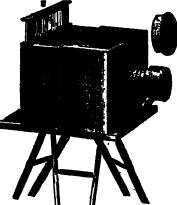

In order to avoid criticism and dissatisfaction which could result from the organization of an Exhibition Activity whose participants were inclined to regard themselves as superior to other members of the club, the activity could be organized as an honorary group to which members might be elected as their abilities become recognized. Since the Exhibition Activity cannot serve beginners, only the club itself can decide whether membership in the activity should be honorary, or the activity should comprise a working team to represent the club in major competitions and exhibitions, or should be a study group.

Any club's Exhibition Activity could make a start by assuring the club of regular representation in the PSA Club Print, Slide, or Movie Competition, the PSA Annual Exhibition, and other recognized competitions and exhibitions.

Duties of the activity and its director should include keeping club members informed of dates and pertinent data relative to forthcoming exhibitions. The activity also might take upon itself the duty of making sure that every capable member of the club regularly enters prints in recognized shows. (To Be Continued)

The camera obscura

Daguerreotype Camera rst of the

Daguerreotype of Harriet Beecher Stowe

In the Morning Herald, September 30, 1839, New Yorkers were mystified to read of the "new mode . . . of taking on copper the exact resemblances of scenes and living objects through the medium of the sun's rays reflected in a camera obscura . . . Ladies, if they are pretty, with small feet and delicate hands, fond of science, ought to call and see it." The news item announced the first daguerreotype ever made in this country. That the reporter had difficulty in describing a daguerreotype to readers who had never seen one is understandable but why he thought only pretty women with small feet would be interested remains baffling. Whatever idea he intended to convey, he couldn't have dreamed that he was recording the initial stage of a process that one day would afford profit and pleasure to millions.

In August 1839 Louis Daguerre had demonstrated the process which came to bear his name to an awe-stricken group of French scientists. September 20, 1839 is considered the birthday of American photography for on that date a steamship arrived with accounts of Daguerre's process and at once several men in this country began experimenting. Though prior claims were advanced, on the basis of available evidence D. W. Seager is believed to have been the first to make a successful daguerreotype in

America. Dr. John William Draper, professor of chemistry at the University of the City of New York, made the first "heliographic portrait," a picture of his sister Dorothy.

A noted pioneer in the field was Samuel F. B. Morse who on a visit to France had already met Daguerre and learned of his process. Besides being the inventor of the telegraph, Morse had won distinction as a portrait painter and for many years was president of the National Academy of Design. With Dr. Draper he opened a photographic studio and later started a school of photography in a "glass palace" on the roof of a building. His school was immediately successful and attracted many students who later became well-known. Because of his contributions to the field, notably his work as a teacher, Morse is sometimes called the Father of American Photography.

First attempted by men of scientific bent, in time the art of daguerreotypy was taken up by others less capable of mastering its principles or unwilling to spend time perfecting their technique. As a financial depression existed during the early days of the daguerreotype, no doubt many of the unemployed turned to the discovery as a hopeful possibility; others took it up as a side line. In later years a writer recalled that watch repairers, dentists, blacksmiths and cobblers sometimes doubled as

Gurney's "daguerrean saloon" on Broadway

Dr. John William Draper

daguerreotypists so that "it was possible to have a horse shod, your boots tapped, a tooth pulled or a likeness taken by the same man."

A group that flourished in small communities attempted to cast an aura of magic about their work and called themselves professors. The deficiencies in their pictures were invariably blamed on the sitter's having moved, winked or otherwise misbehaved, and when such excuses ran out, the "professors" moved to another town.

Partly because of inferior operators, partly because of imperfections in the process itself, some of the early daguerreotypes were fat from pleasing and met with public disfavor. Punsters called them "derogatory types" and in 1843 John Quincy Adams reported having "four daguerreotype likenesses of my head taken—all hideous." Nevertheless, a good daguerreotype is truly admirable and in some respects is not surpassed by modern photographs for it possesses brilliance and shows detail far better than a paper print. The principal defects of the process were the fact that only one copy could be obtained from each exposure, the image is reversed from left to right and

because of the mirror-like surface can be seen only when held in a certain position.

Of the skilled photographers who made a name, for themselves by far the most outstanding was Mathew B. Brady. Born near Lake George about 1822, he studied art as a boy with William Page, portrait and historical painter, who brought him to New York. There he studied daguerreotypy with Morse while working as a clerk at A. T. Stewart's store.

In 1844, Brady rented the top floor at Broadway and Fulton Street, constructed several skylights and opened his own gallery, the first of several. From the beginning his name seemed to work magic and he acquired a distinguished following. During his career he took pictures of notables in virtually every field of endeavor. With one exception he photographed every President from John Quincy Adams to and including William McKinley. The exception was William Henry Harrison who died in 1841 a month after taking office. Though renowned for his remarkable Civil War photographs, in the opinion of some authorities Brady is even more outstanding for his

portraits. However, as time went on, he delegated much of the actual work to his well-trained staff, whose products were indistinguishable from his own.

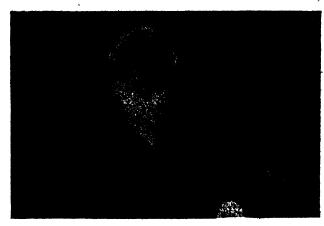

Brady's genius was best evidenced by his many portraits of Lincoln. Previously considered an uncouth backwoods lawyer, "half alligator and half horse" in appearance, Lincoln was revealed through Brady's photographs as a man of commanding dignity. In later years Lincoln himself declared that Brady and the Cooper Union speech had made him President.

One of Brady's New York galleries was frankly advertised as being over Thompson's saloon. Inasmuch as having one's picture taken involved a long period of sitting motionless in the clutches of the head clamp or "immobilizer" under the hypnotic eye of the camera, it has been said that undoubtedly many subjects fortified themselves at Thompson's before undergoing the ordeal. The most luxurious of Brady's galleries was opened with a reception and a preview for invited guests. For the benefit of ladies in formal attire, a feature of this elegant establishment was a private entrance which "obviated the necessity of passing through the public gallery."

In 1851 Brady's daguerreotypes won first prize and one of three medals at the World's Fair in London. Some years later the Prince of Wales recalled the fact when he visited America and chose Brady as his photographer to the chagrin of rival galleries. It was on Brady's trip to London that he met Alex Gardner who afterwards became one of his ace photographers and eventually opened his own studio. On the same trip Brady learned about a new process known as the "wet plate" which could make any number of prints from one negative and which he no doubt realized would sound the death knell of the daguerreotype.

Brady was by no means the only talented photographer of his day. Among those who gave him stiff competition were Jeremiah Gurney, John Plumbe, E. H. Anthony in Washington and in Boston the firm of Southworth and Hawes.

Throughout the country the vogue spread. Even remote communities which had no "resident artist" were favored by visits from itinerant daguerreotypers carrying their equipment in horse-drawn vans like those used by Yankee peddlers, and floating studios on the Mississippi catered to river people.

Samuel F. B. Morse

At the height of the fad, one enterprising hat store advertised that a free daguerreotype of the purchaser would be inserted in the lining of every hat sold, which would be a great convenience in identifying one's own headgear.

By 1853 when the daguerreotype reached its zenith, it was estimated that 3,000,000 were being produced annually. For a few more years this method continued but was soon supplanted by collodion photography. For a time the ambrotype, a thin collodion negative on glass, was highly popular but at an exhibition in 1857 it was noted that scarcely a daguerreotype was seen and few ambrotypes. "Photographs on paper and canvas, from the miniature to the life size, eclipsed every other style."

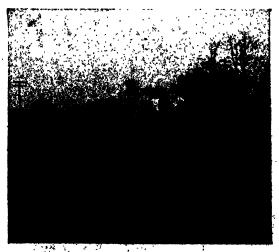

Deserving of mention are the card photographs, the size of a visiting card, and the tintypes made on black japanned iron which flourished during the Civil War period. These are said to have inspired the slang phrases, "He's a card" and "Not on your tintype." For many years there was also an enormous vogue for stereoscopic pictures with their breathtaking illusion of space and reality.

For some years two important adjuncts of most parlor tables were the stereoscope and the family album, and the latter was the direct result of the card photograph fad. Left by visitors instead of calling cards, at first these little pictures were kept in a tray and in a basket when that overflowed, but eventually a more permanent and capacious resting place was required. And so the album

(Right) Photography's early drawbachs didn't discourage the ladies from entering the field

PSA JOURNAL, Vol. 18, June 1952

Head-clamp kept sitter rigid—and very uncomfortable

was introduced and became a cherished household possession as well as a means of entertaining visitors that ranked with today's television sets. Though to modern eyes many of the old pictures are definitely mirth-provoking, it is probable that visitors used to find them more boring than hilarious. One can't help wondering, however, if a few of the swains who were "entertained" by viewing the album weren't daunted by the appearance of some members of their prospective family.

The popularity of the card photograph and the album proved a bonanza to the photograph business. Not only were pictures distributed in great numbers to friends and acquaintances but photographs of all the notables of the day were sold in enormous volume. Buildings and scenes were also photographed and even equine favorites reproduced on what were waggishly referred to as "cartes de horse."

Some of these commercial card photographs were bought by admirers or were used in making the collections which were then a hobby. Many others were in demand by artists and engravers who desired an accurate reproduction of various notables.

During the War Between the States commercial photography was given impetus by camp-following photograph studios. In 1862 the war correspondent of the New York Tribune commented: "One of the institutions of our army is the traveling portrait gallery... The amount of business they find is remarkable. Here for instance near General Burnside's headquarters there is the combined establishments of two brothers from Pennsylvania. They have followed the army for more than a year and taken the Lord only knows how many thousand portraits. In one day since they came here they took in one of the galleries, so I am told, 160 odd pictures at \$1.00 (on which the net profit was probably ninety-five cents each). If anybody knows an easier and better way of making money than that, the public should know it."

Originally, the field of photography was confined to men who were interested in its scientific aspects or who took it up as a means of livelihood but gradually the first of the present legion of amateurs appeared. Considering the effort involved, in the days of collodion plates the amateur had to have physical stamina as well as a lot of enthusiasm. Before taking a picture he had to prepare his iodized collodion, flow it on the plate, allow the film thus formed to set, bathe it in a silver sensitizing solution, and then he had to expose and develop the plate while it was still damp. On field trips therefore he had to tote along his own darkroom in addition to his cumbersome equipment. The tents often used for the purpose, sometimes transported on a wheelbarrow, could be folded and moved from place to place but they were cold in winter and hot in summer. Despite these drawbacks, photography was recommended to ladies as a hobby "by no means as difficult or as laborious as needlework."

It is interesting to note that photography was known by many names during its process of development; sun drawings, sun pictures, heliographs, the pencil of nature, photogenic drawings, calotypes, as well as the more familiar daguerreotypes. The terms photograph, positive and negative were introduced by Sir John Herschel, an eminent English astronomer, and were slow in being adopted.

No account of the pioneers in photography would be complete without mention of the men who recorded the opening of the West, best known of whom is the late William H. Jackson, Hon.FPSA. Besides making a tour of the newly completed Union Pacific route, he served as official photographer for the Hayden Geological Surveys and took the first known pictures of many scenic marvels in the West. As a result of the survey of 1871 and Jackson's photographs, a bill was introduced in Congress setting aside the Yellowstone as the first national park. Even then photography had gone far.

IT HAPPENEO IN BROOKLYN

By Alfred C. Schwartz

The promotion of interest in amateur photography is, after all, the prime target of most of our efforts. When this mission is accomplished through the cooperation of several elements in a community in the spirit of local pride and public service, it is worth recording as an example for other communities and photographic groups. The prototypes of those who combined for the promotion of amateur photography in Brooklyn exist in every town of any size.

"Brooklyn-by-Brooklynites", the Salon which required that picture material be found in Brooklyn, and by residents of Brooklyn, was unique in itself. How Brooklyn officialdom, press and commercial organizations rallied forces to insure its success is an inspiration to camera enthusiasts everywhere.

To combat a lethargy which had grown among camera enthusiasts, the camera clubs in Brooklyn formed a federation, called the Brooklyn Conference of Camera Clubs, with the blessing of the Metropolitan Camera Club Council.

Each club contributed \$10 to begin activities, and with this small sum and plenty of leg work and economy, an inter-club competition was held which stirred up intense interest among the clubs.

To increase membership in the clubs and the public's interest in them the prints were exhibited in the main Public Library. Individual clubs sent their entries on tours of public places and camera stores.

This set the stage to invite the amateurs who are not affiliated with clubs to compete and exhibit. Mr. Robert R. Morris, camera editor of the *Brooklyn Eagle*, was enthusiastic. He had often expressed a hope that the important and beautiful aspects of Brooklyn would be properly, recorded via photography. Thus was born the idea for a salon, "Brooklyn-by-Brooklynites". Mr. Morris and his associates on the *Brooklyn Eagle* offered to provide a cup or trophy, editorial support and other cooperation.

Borough President John Cashmore, the governmental head of our 3 million people, offered his support and provided the John Cashmore Trophy, the prestige of his office, and a display rack with excellent lighting facilities built in the rotunda of the Boro Hall for the exhibition.

To maintain the Brooklyn flavor throughout, it was decided that the panel of judges must not only be one of unquestioned integrity and experience, but must be residents of the borough. To our delight we found that we not only had the talent who would serve as promoters of our avocation, but that a superb panel could be

what clubs have to offer them, and a second visit was required to pick up prints after the exhibition.

Photographic supply stores offered substantial cooperation. All of this was respectfully declined for the present, except for one which preferred to remain unnamed when supplying beautiful salon stickers for the accepted prints. (This proferred assistance by the stores may be the basis for the next conference competition.)

The trucks of the *Brooklyn Eagle* carried large billboards on both sides for two weeks before the exhibition opening, and throughout the salon.

The New York press as well as the Brooklyn Eagle gave the story coverage at at the presentation ceremonies at the Boro Hall and in addition to the news coverage Brooklyn's leading department store, Abraham & Straus, without solicitation and purely as a public service, took a non-commercial special quarter-page ad congratulating the winners, dwelling upon the excellence of the exhibit and urging one

BROOKLYN AWARDS—R. R. Morris; Hon. John Lynch, Commissioner of Public Works; E. C. Wilson, Pres. Brooklyn CC Conference; A. C. Schwartz; and Dr. J. N. Levenson.

assembled from among the capable judges in the area.

The all-PSA judges chosen were Mrs. Olga Emma Irish, FPSA; Mrs. Barbara Green, FPSA; Mr. Samuel Grierson; and Mr. Robert R. Morris.

The entry forms were printed by the Brooklyn Rogle. Distribution was undertaken by two delegates to the conference. All entry forms were distributed through camera stores which helped bring those interested into the Brooklyn stores.

Prints had to be brought personally to camera clubs in Brooklyn on meeting nights. Their addresses and meeting nights were widely publicised in the New York press, which were entirely cooperative throughout the project. Having the prints brought to the clubs familiarized many amateurs with

and all to visit this showing of the beautiful spots in our vicinity.

The diligence and enterprise of amateur photographers brought to light many beautiful and interesting scenes which resulted in a surprising and varied showing. The expression of interest by the public in close-to-home scenes hitherto unappreciated was general.

As a project for the improvement of photography in any community and as a rallying point for cooperation of public, press, government and business for the public interest, we have presented this experience as a guide and model to other towns and sections of cities.

The Borough President rewarded all exhibitors with a Certificate of Honorary Citizenship in Brooklyn, U. S. A., encased

STANLEY D. SOHL, Associate Editor

The Far East

The Taj Mahal, snake charmers, bed of spikes, elephants, rice paddies, and scantily attired dancers, all give the vision of the enchanted land of India. Hot humid days and nights, Monsoon rains, beautiful sunsets, and glorious clouds, greet the imaginary eye as the word India is mentioned. India, the home of the struggling masses and the home of a new nation is also the home of a man very much interested in photography. He is Dhrura Coomar Engineer, APSA, ARPS, of Ahmedabad, India. Mr. Engineer is the General Secretary of the India-American Portfolios for India and Pakistan.

India-American Portfolios

From material by D. C. ENGINEER

The birth of the Indo-American Portfolio Activity took place here after the guns of the Second World War had cooled down. So we may call this activity a post war child of 1947. During its five years' career, four Indo-American portfolio circles are in operation, conducted by Cameramblers of Bombay, Gujarat Photographic Postal Circle of Ahmedabad, Madras, Amateur Photographic Society of Madras, and Photographic Society of India, at Bombay. These circles, sponsored by these organizations, form the India side by exchanging their portfolios with those Americans of the PSA International portfolio circles.

This Indo-America portfolio activity has created a good repute in India, especially in the photographic world, because in each circulation its members can come across a few tempting American prints and they are much impressed by the technical side of the photographs. Many times, though, the Indian members have something to say regarding the pictorial value of many of the American photographs which are circulated in the portfolios. Mr. Engineer says, "we are less impressed by the pictorial merit of your included pictures especially

in your new pictorial approach of action photography. Our pictorialists are always fond of the 'Old School' of photography, according to which, composition, story telling ability, and simplicity are the backbone of a successful picture."

This activity of exchanging pictures and portfolios, has not only aided and helped us in our study, appreciation and reading of pictures, but this type of artistic cooperation and circulation will definitely bring us, that is, Bharat and America, nearer in the understanding of social, cultural and economic aspects of our daily life. Mr. Engineer has noticed that many inquisitive and eager students of photographic art from America have begun corresponding with our workers here in India, and always asks for explanations regarding some of our social customs, costumes, and religious implications of some of our pictures included in the portfolio, and this gives us an opportunity to explain ourselves and thicken the bonds of brotherhood. India is, as you can appreciate, a nation with subtle, social and religious customs, much of which is often represented in their pictures. The Indian photographer thinks it is time that America, and other continents of the world, should try to understand India in a better and proper way with photos and pictures being one of the easiest media which can successfully accomplish their aim.

In both the continents, circulation of the Indo-America portfolio among their members is somewhat slower than its scheduled time. Mr. Engineer does not know what is the problem in American circulation, but he can very well tell the causes of delay in their circulation:

"First, our members are somewhat reluctant in attending the portfolio on its arrival and posting the same to the next member.

"Secondly, on receiving the folio, many of our members show it to their other photographic friends and also they take it to their weekly photographic club meeting to display it to their co-workers and hence the portfolio is often delayed. This type of practice is enticing more interest in the I-A circles and therefore besides our individual members, many enthusiasts are able to see American prints and gain through this activity indirectly. We have no objection if the members do all this on time but their obliging attitude should not be a hindrance in the smooth running of the folio and delay the same in circulation.

"Thirdly, sometimes members have no picture ready to be included in the folio, so they post it to the next member without including their new picture. Ultimately, when the portfolio comes to the circle secretary he has to approach these members once more to send in their pictures. This procedure takes a good deal of time after the conclusion of the circulation and before it is despatched to the General Secretary.

"Fourth, a few members are not wellversed in English, so they have to depend upon some of their friends to write the criticism of pictures for them and this adds to the delay in circulation.

"Fifth, portfolio secretaries also, at times, seem somewhat reluctant to remind their members to push the folio further. So this is also a reason for the source of delay in portfolio circulation."

And lastly, Mr. Engineer would request all the members and circle secretaries, of both continents, to pay their fullest attention to a smooth and scheduled running of their portfolio circles. Mr. Engineer also requests that the American circle members put their best pictures in each circle circulation and by doing this the best portraitures and pictures of highest pictorial value will make the Indo-America portfolio circles more popular and a more permanent source of inspiration of higher pictorial standard.

It has been suggested many times that the Chariman and the Director of Pictorial Division, PSA International Portfolios look to the present conditions of India and arrange more portfolios. The Indian youth is fast becoming camera minded and the number of present portfolios is small and not sufficient to meet their anxieties about the American progress in photography. Hence it would be quite in the fitness of time and circumstances that some 2 to 3 more such portfolios should be started in order to meet the increasing demand.

Shooting Ducks or Pictures?

Mr. Engineer also writes, "we have just ended our winter season. During this season I had many opportunities to develop my hobbies-photography and shooting. During the whole season, I was busy doing both. More than a half dozen times we went shooting ducks, bucks, wild boars and wild Asiatic asses and now we are planning to go, in the very near future, big game hunting of tigers and panthers. I had also arranged our club's (Camera Pictorialists of Ahmedabad) annual outing for four days in the remotest villages of our province. Perhaps this is the first time a camera club ever arranged a photographic tour of India for so many days at one time. I had exposed some 6 rolls of film in my Rolleicord camera, and I expect at least a few good pictorial products."

Great News for the Salonist

In October 1952, for the first time in the photographic history of India, a joint International Photographic Exhibition in monochrome and in natural color prints will be held first at Ahmedabad in the Sheth Mangaldas Memorial Town Hall and then at Bombay in the Jehangir Art Gallery under the joint auspices of the Camera Pictorialists of Ahmedabad, the Camera Pictorialists of Bombay, and the Photographic Society of India.

The Jury of Selection consists of J. N. Unwalla, FRPS, Chandulal J. Shah, FRPS, Dhruva C. Engineer, APSA, ARPS, N. J. Nalawalla, ARPS, and B. B. Fanibanda in the monochrome print section; and K. B. Khopker, ARPS, D. K. Mehta, and J. Mistry in the natural color print section. The closing date is 5 August 1952.

This is a unique opportunity for the pictorial workers of the world to send in their outstanding works to be exhibited in the first salon conducted under the joint

sponsorship of the leading photographic societies of India.

Silver and bronze plaques will be awarded for prizes in both sections.

Hard Work

To build up such a fine network of portfolios, secretaries, and workers is a real job; a job well done by the two men of the India-American setup, Mr. D. C. Engineer of India and Mr. Don E. Haasch of Boise, Idaho. These men have worked hard and long to develop a network that really is paying off in great dividends. We want to congratulate them on their unselfish work.

PSA International Portfelios

There are openings in the following PSA International Portfolios for Pictorial Division members who are interested in interchanging prints for comment and analysis with the leading photographers in foreign countries:

MISS EVELYN ROBBINS, Associate Editor

Chirps from the Robbins

Don't allow yourself to be the member of your circle that becomes a "social outcast". Are you thinking that that expression sounds silly?

Believe me, it is far from being "silly"! In fact it is something you should be ashamed to admit—if you are guilty of acquiring such a stigma.

Maybe you think that it can't happen to YOU—it could only happen to the

"other guy"! It CAN happen to you; and very easily, too!

Here are just a few very simple rules of thoughtfulness for you to follow if you want to be considered "one of the gang"; and proudly so,
